

prairie milkweed

Asclepias sullivantii

Kingdom: Plantae
Phylum: Magnoliophyta
Class: Magnoliopsida
Order: Gentianales
Family: Asclepiadaceae

ILLINOIS STATUS

common, native

FEATURES

Prairie milkweed is a smooth, perennial herb with a milky sap. The leaves are arranged opposite each other on the stem. The simple, entire leaves may be sessile or on a short stalk. Flowers develop in a cluster at the stem tip. The five, downward-pointing petals per flower support five, inwardly curving horns. Flowers are purple and about three-eighths inch in length. The fruit is a long, pointed, smooth seedpod. Prairie milkweed may attain a height of two to four feet.

BEHAVIORS

Prairie milkweed may be found statewide in Illinois but is much more common in the northern two-thirds of the state. It grows in moist to wet prairies. Flowers are produced from June through July. Flowers are pollinated by insects, and seeds are wind-dispersed.
