

wolf spider *Gladicosa pulchra*

Kingdom: Animalia

Division/Phylum: Arthropoda

Class: Chelicerata

Order: Araneae

Family: Lycosidae

ILLINOIS STATUS common, native

FEATURES

Wolf spiders are very common and have four small eyes below four large eyes. The arrangement of the eyes allows them to see in all directions. Individuals of this species range from gray to brown in coloration. No matter the shade, though, there is a light-colored band in the midline of the cephalothorax. The female of this species is about six-tenths inch in total body length, while the male is slightly smaller, a little less than one-half inch.

BEHAVIORS

This species lives in woodlands. *Gladicosa pulchra* hunts on the ground, in leaf litter and in trees. Adults are active from spring through fall. Females carry the egg sac with them, and after the young hatch, the females carry them for about two weeks. These wolf spiders are hunters, and catch prey by waiting in a spot, then rapidly moving to bite it or cage it in its legs before biting it.

HABITATS

Aquatic Habitats

none

Woodland Habitats

upland deciduous forests

Prairie and Edge Habitats

none
