2016-17 Hunter Harvest
Harvest estimates used in this report are based upon results from the 2016-17 Illinois Hunter Harvest Survey. An estimated 22,425 hunters (down 4.9%) harvested 90,411 rabbits (down 20.7%). Rabbit hunters averaged 1.06 rabbits per trip (up 21.8%) in the 2016-17 hunting season. This was the fourth-year that rabbit season ended February 15.

Weather 2016-17
The winter of 2016-17 was relatively mild and winter mortality due to weather was likely low for rabbit. Spring brought above-average rainfall that may have been problematic for early rabbit litters in May and early June. From late June through most of August, weather conditions improved across much of the state (with parts of northern Illinois being the exception due to record flooding). Overall, 2017 weather conditions were good for rabbits during their peak breeding season.

Rabbit Population Index
The road-kill index provides a measure of rabbit trends for Illinois that has been recorded since 1975. The road-kill index is calculated by tracking the number of road-killed rabbits counted in June and July per thousand miles traveled by observers. This year’s road-kill index was 2% higher than 2016 with 1.7 rabbits per 1000 miles traveled.

2017-18 Season Outlook
Statewide trends show that rabbit numbers are roughly the same as last year’s levels, so in areas with good habitat, hunters should find good numbers of rabbits. It is also noteworthy that despite a lower harvest and fewer rabbit hunters for the second year in a row, the number of rabbits harvested per day was up again this year. The pace of fall harvest for Illinois is close to normal with corn harvest 14% behind the 5-year average and soybean harvest 16% ahead of last year. This should find most of the crops out of the fields by the time upland game season opens.

Best Areas
Look for farms with a mix of small fields with shrubby fencerows, old pasture, forest edges and areas of young or recently harvested timber. The most productive areas for rabbit hunting continue to be in west-central and southern Illinois. Based on the average annual harvest estimates from 1997 through 2016, some of the top counties are: Bond, Calhoun, Clay, Clinton, Madison, Marion and Wayne

Habitat Management Tips: Rabbit + Habitat = ‘Rabbitat’

- Brush piles are a staple for ‘rabbitat’. Piles should be at least 10’ in diameter and 3 – 5’ high. Strategically placing them near blackberry brambles, shrub thickets, fence rows, etc. will maximize their benefits. Another tip is to build them over the top of small rock piles, old fenceposts or cinder blocks. Replace or add brush to them every 3 – 5 years.

- October and early November are good times to prepare for ‘edge feathering.’ This practice is simply dropping non-desirable trees along the edges of field borders to provide escape cover on field edges. Before cutting trees (and before a hard freeze), spray any brome or fescue in the landing zone with glyphosate to ensure open areas beneath the trees after they are dropped. Cut trees through March.

- Break up mowing times to ensure some suitable escape cover for rabbits throughout the year. Try not mow more than 1/3 or 1/4 of any fields, waterways or fallow areas at a time. Nesting season runs from March 1 – August 31. This selective mowing strategy is also important to pollinators like monarch butterflies, grassland birds and other wildlife that need cover and food throughout the growing season.
Thank you for your interest in the annual rabbit report. Have a safe and enjoyable hunting season in 2017!

Please take the time to introduce a kid to hunting!

Season Dates
November 4, 2017 – February 15, 2018 (Statewide)

Hours
Sunrise to Sunset

Bag Limits
4 per day with 10 in possession after the 3rd day
