Re: LPC#0390055036—DeWitt County
Clinton/Clinton Landfill #3
Compliance File

Dear Mr. Welk:

On April 28, 2014 an inspection of the above referenced site was conducted by Dustin Burger representing the Illinois Environmental Protection Agency. The purpose of this inspection was to determine the site's compliance with the Illinois Environmental Protection Act and 35 Illinois Administrative Code G regulations.

No violations were noted at the time of this inspection. For your information, a copy of the inspection report is enclosed.

Please contact Dustin Burger at (217) 278-5800 if you have any questions regarding this inspection.

Sincerely,

A handwritten signature in black ink, appearing to read "P. Purseglove", written over a horizontal line.

Paul M. Purseglove, Manager

Narrative Inspection Report

I conducted a routine inspection at the above referenced facility on April 28, 2014. This inspection was conducted to determine the regulatory status and evaluate compliance with the Environmental Protection Act (Act) and Title 35 Illinois Administrative Code, Subtitle G: Land Pollution (Regulations). Dave Bryant, the Site Manager, accompanied me during the visit. Eight photos were taken of Unit #3. The weather was mostly cloudy with mild winds from the southeast, and temperatures in the 50s. The weather since the last inspection would generally be described as a wet, cool spring.

Site Inspection

When I arrived at the landfill I checked in at the landfill office. Mr. Bryant was not present in the office, so I drove to the scalehouse, where Dave met me. While at the scalehouse I checked through the several manifests, including one for a tanker truck that was on the scales while I was present. The tanker truck had contained sludge from the clean-out of an oil/water separator at the Clinton Nuclear Power Station. The waste contained water and sediment from the bottom of the separator tank and was designated for solidification and disposal in Unit #3. It could not be certified as non-special wastes since it was a pollution control waste, and could not pass a paint filter test.

The genre of wastes that requires a special waste manifest is fairly small compared to the overall amount of waste received at the landfill. Historically, special wastes were a classification placed in Illinois law to regulate hazardous wastes before there were any federal hazardous waste regulations. At the time the category was created, any industrial process waste was considered a special waste and required an individual wastestream authorization permit from the Agency before disposal. The special waste category was narrowed when Federal government regulated the category of hazardous wastes and excluded them from landfills. The special waste authorization process was overly burdensome and was changed in facility's permits to allow the landfill to authorize the landfill to accept special wastes on a generic basis if the waste met the requirements in the facility's permit.

Now the category of special wastes has been further narrowed. Section 22.48 of the Illinois Environmental Protection Act ("Act") excludes certain non-liquid, non-

hazardous industrial-process and pollution-control wastes from the definition of special waste, provided that generators certify that these wastes meet all the requirements of Section 3.475(c)(1).

Any business generating non-liquid, non-hazardous industrial-process or pollution-control waste has the potential to certify that these wastes can be disposed of as non-special waste.

Section 22.48 of the Act stipulates certification must include the generator's verification that the waste:

1. is not hazardous
2. is not a liquid (as determined by paint-filter test SW-846 Method 9095)
3. is not regulated asbestos-containing material as defined in 40 Code of Federal Regulations, Section 61.141
4. does not contain polychlorinated biphenyls (PCBs) regulated in accordance with 40 Code of Federal Regulations, Part 761
5. is not formerly hazardous waste rendered non-hazardous
6. and does not result from shredding recyclable metals (e.g. auto fluff).

Additionally, each certification must have attached:

1. a statement explaining how the generator determined the waste is neither hazardous nor liquid
2. a description of the process that generated the waste
3. any relevant material safety data sheets
4. and results from analytical testing (signed and dated by the person who completed the analysis), or an explanation why testing was not needed

Many of the wastestreams that were formerly considered special wastes have had the above determinations to now be considered declassified as special wastes.

At Clinton Landfill, several of its largest industrial wastestreams from its biggest customer have been certified as non-special wastes. This would include many food-based byproducts from customers such as Tate & Lyle and ADM. Wastes such as waste corn starch, humin cake, filter aid from filtering vegetable oils, bed ash, etc. are not toxic and do not need any special handling.

The biggest waste streams that are still considered special wastes are those that do not meet the paint filter tests and need solidification. The oil/water separator sludge I observed entering the landfill is an example. Others include wastewater sludges from the clean-out of pipes or tanks at facilities such as ADM or municipal wastewater treatment plants. Other common special wastes include contaminated soils from leaking underground storage tank (LUST) sites and dusts from metal foundries. The facility

submitted its Special Waste Annual report to the Agency which was received on January 27, 2014 and is attached to this report. The report lists the 37 facilities from which Clinton Landfill has received waste and the waste totals from each generator.

When we left the scalehouse we drove to the active area located in cell 5A1. We watched several trucks unload (photos 1 & 5). In addition to several regular municipal waste trucks, one truck carried waste starch from Tate & Lyle, another enclosed semi-trailer carried huge rolls of fiberglass from Fibertech in Danville, Illinois. The fiberglass looks like a an enormous roll of white plastic that is used to back shingles/ It bears no resemblance to the fluffy pink stuff you see in house insulation. The semi-trailer carrying the fiberglass used the truck tipper to unload its waste. Bryant said Fibertech was now the only customer to use the tipper, as the landfill lost the contract with the company that formerly used the tipper to unload transferred municipal waste.

I did not see any banned waste, such as electronics, landscape wastes, or tires in any of the loads. The area around the active area was well covered with no exposed waste. No litter was present in the area.

East of the active area the facility was beginning to excavate for what will eventually be Cell 5B (photos 2 & 6). The cell is slated to be complete that the end of the 2014 construction season. The cell is slated to be built in late summer/early fall, but overburden soil was still being excavated, although at a slower pace than my previous inspection. Bryant estimated there is another 15 feet of soil that will need to be removed before the floor is at bottom grade.

The waste solidification area on top of Cell 1C was not being used during the inspection (photo 3). The truck I observed leaving the facility had just emptied its contents into the container, but it was not yet being mixed with reagent to soak up the moisture. The area around the solidification area was now free of blowing particles from the solidification process. During my last inspection I had noted that dust had blown from the piles of wetted ash onto the side slope of the landfill. The landfill responded to this concern by making sure the end product was wet enough it would not blow, but would still pass the paint filter test. The permit requires that a berm be placed around the solidification area. A small berm to prevent liquids from escaping is present. A larger one could mitigate any blowing dust.

The trees and sedimentation pond on the north side of the facility were free from litter.

The landfill has installed the piping and leachate knock-out tank for a new gas header for the landfill gas collection system (photo 4). Seven new gas wells and a larger flare will also be installed.

The gas flare was lit and working properly. The flare burns a little over 100 cubic feet of landfill gas per minute. As a comparison, the gas engines at the gas-to-energy plant serving Unit #2 can burn 900 cubic feet per minute. The plan is to switch the flares from Units #2 and #3. The smaller flare rated at 350 cubic feet per minute can serve Unit#2 as

a backup to the gas-to-energy plant. The facility has seen the gas production at Unit #2 go down over time. The large flare rated at 750 cubic feet per minute (cfm) will be installed at Unit #3, which, with the installation of seven new gas wells, is expected to produce landfill gas at a rate of 400-450 cfm.

We then drove to the Chemical Waste Unit (CWU). I asked Mr. Bryant if the CWU was being used much. He said since winter they had not received any Manufactured Gas Plant (MGP) waste in the unit since my last inspection. He added that the non-MGP wastestream designated for the unit, a fluoride salt from 3M Corporation was now being received again in the CWU as the plant that produces the material was back up and working again.

The waste in the CWU cell was adequately covered by cover soils. I took two photos of the area (photo 7 & 8). The eastern half of the cell was still unused and had the protective plastic cover in place over the cell to prevent rainwater or snowmelt from entering the leachate collection system.

Currently the landfill is not solidifying the leachate from the CWU, finding it was taking up too much airspace with the resulting solids. The leachate is instead hauled to Peoria Disposal Company (PDC) #1 for treatment in their wastewater treatment facility.

Permitting

The facility is operating under permit 2005-070-LF, which expires on February 15, 2017. The permit renewal application was granted in Modification 29 on July 7, 2012. The permit includes a 157.451 acre waste disposal area with a gross airspace of 32,014,225 cubic yards. At current waste disposal rates, the space is estimated to last 45 years.

Permit Modification 45 issued on April 28, 2013. This modification approved the alternate source demonstration for 3rd and 4th quarter 2012 confirmed exceedences and 3rd Q 2013 select exceedences. This is the last permit modification on file.

The estimate for closure of the current landfill's 29 acres of municipal solid waste disposal and 6.14 acres comprising the CWU is \$10,475,467. This value includes \$4,591,217 for premature closure, and \$5,844,250 for post-closure care. The landfill currently has \$10,932,021 in posted financial assurance.

Records Review

The facility has 60 groundwater monitoring wells installed. Fifteen upgradient and 45 downgradient wells monitor the four groundwater zones beneath the landfill. There have been no new groundwater reports imaged and available for review since my last inspection.

For the latest, groundwater information, I will refer the reader to the extensive April 1-2, 2014 groundwater inspection report prepared by Jeff Tuner. Jeff Turner, the Agency's

Regional Geologist, split samples from four wells during the first quarter of 2014 after delays due to frozen wells. Mr. Turner compiled a complete listing of every groundwater exceedence, whether the exceedence has been confirmed, and the permit number that has addressed the exceedence. The final conclusion of the report is that there were no outstanding groundwater violations at the site.

The landfill disposes of leachate in one of three ways. First, the liquids can be recirculated. Unit #3 does not yet have a recirculation systems installed. Second, leachate and landfill gas condensate can be solidified with ash and disposed as solid waste. Thirdly, leachate can be hauled off site for disposal. MSW leachate is hauled to Bloomington-Normal Water Reclamation District, while the CWU leachate is manifested to Peoria Disposal Company's PDC #1 wastewater plant where it is pre-treated and discharged to the Peoria Sanitary District. A summary of the landfill's leachate management with total amounts handled are attached to this report.

Summary of Apparent Violations

No violations were noted during the inspection

Annual Report Certification

The owner, operator or an authorized representative must sign and date this certification.

Any person who knowingly makes a false, fictitious, or fraudulent material statement, orally or in writing, to the Illinois EPA commits a Class 4 felony. A second or subsequent offense after conviction is a Class 3 felony. (415 ILCS 5/44(h))

I certify under penalty of law that I have examined and am familiar with the information submitted in this and any attached continuation sheets or other attached documents, and that based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the submitted information is true, accurate and complete, I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment.
