CHICAGO, IL 60604-3590

REPLY TO THE ATTENTION OF:

WW-16J

SEP 28 2016

Sanjay Sofat, Chief
Bureau of Water
Illinois Environmental Protection Agency
P.O. Box 19276
Springfield, Illinois 62794-9276

Dear Mr. Sofat:

The U.S. Environmental Protection Agency has conducted a complete review of thirteen final Total Maximum Daily Loads (TMDLs) for eleven atrazine/simazine impaired waters, including supporting documentation and follow up information. The waterbodies are located in southern and west-central Illinois. The TMDLs for atrazine/simazine submitted by the Illinois Environmental Protection Agency address the impaired designated General Use for the waterbodies.

The TMDLs meet the requirements of Section 303(d) of the Clean Water Act and EPA's implementing regulations at 40 C.F.R. Part 130. Therefore, EPA hereby approves Illinois's thirteen TMDLs for atrazine/simazine as noted in Table 1 of the enclosed decision document. The statutory and regulatory requirements, and EPA's review of Illinois's compliance with each requirement, are described in the enclosed decision document.

We wish to acknowledge Illinois's effort in submitting these TMDLs and look forward to future TMDL submissions by the State of Illinois. If you have any questions, please contact Mr. Peter Swenson, Chief of the Watersheds and Wetlands Branch, at 312-886-0236.

Sincerely,

A handwritten signature in blue ink that reads "Tinka G. Hyde".

Tinka G. Hyde
Director, Water Division

Enclosure

cc: Abel Haile, IEPA

TMDL: Illinois Atrazine/Simazine TMDLs (13)

Date: **SEP 28 2016**

DECISION DOCUMENT FOR THE APPROVAL OF THE ILLINOIS ATRAZINE/SIMAZINE TMDLS

Section 303(d) of the Clean Water Act (CWA) and EPA's implementing regulations at 40 C.F.R. Part 130 describe the statutory and regulatory requirements for approvable TMDLs. Additional information is generally necessary for EPA to determine if a submitted TMDL fulfills the legal requirements for approval under Section 303(d) and EPA regulations, and should be included in the submittal package. Use of the verb "must" below denotes information that is required to be submitted because it relates to elements of the TMDL required by the CWA and by regulation. Use of the term "should" below denotes information that is generally necessary for EPA to determine if a submitted TMDL is approvable. These TMDL review guidelines are not themselves regulations. They are an attempt to summarize and provide guidance regarding currently effective statutory and regulatory requirements relating to TMDLs. Any differences between these guidelines and EPA's TMDL regulations should be resolved in favor of the regulations themselves.

1. Identification of Waterbody, Pollutant of Concern, Pollutant Sources, and Priority Ranking

The TMDL submittal should identify the waterbody as it appears on the State's/Tribe's 303(d) list. The waterbody should be identified/georeferenced using the National Hydrography Dataset (NHD), and the TMDL should clearly identify the pollutant for which the TMDL is being established. In addition, the TMDL should identify the priority ranking of the waterbody and specify the link between the pollutant of concern and the water quality standard (see section 2 below).

The TMDL submittal should include an identification of the point and nonpoint sources of the pollutant of concern, including location of the source(s) and the quantity of the loading, e.g., lbs/per day. The TMDL should provide the identification numbers of the NPDES permits within the waterbody. Where it is possible to separate natural background from nonpoint sources, the TMDL should include a description of the natural background. This information is necessary for EPA's review of the load and wasteload allocations, which are required by regulation.

The TMDL submittal should also contain a description of any important assumptions made in developing the TMDL, such as:

- (1) the spatial extent of the watershed in which the impaired waterbody is located;
- (2) the assumed distribution of land use in the watershed (e.g., urban, forested, agriculture);
- (3) population characteristics, wildlife resources, and other relevant information affecting the characterization of the pollutant of concern and its allocation to sources;
- (4) present and future growth trends, if taken into consideration in preparing the TMDL (e.g., the TMDL could include the design capacity of a wastewater treatment facility);
- and
- (5) an explanation and analytical basis for expressing the TMDL through *surrogate*

measures, if applicable. *Surrogate measures* are parameters such as percent fines and turbidity for sediment impairments; chlorophyll *a* and phosphorus loadings for excess algae; length of riparian buffer; or number of acres of best management practices.

Comment:

Location Description: The Illinois Environmental Protection Agency (IEPA) developed thirteen TMDLs for atrazine or simazine in eight lakes and three rivers in southern and western Illinois. By implementing measures to reduce pollutant loadings, the TMDLs will address impairments of the Public Water Supply Use. Table 1 of this Decision Document identifies the waterbodies addressed by the TMDLs as they appear on the partially approved Illinois 2008 303(d) list, Table 2 of this Decision Document contains the locations of the waterbodies, and Table 3 of this Decision Document contains the waterbody characteristics.

As noted in Table 1 of this Decision Document, the TMDL developed for Farina Lake includes a segment of the East Fork Kaskaskia River; water from the East Fork Kaskaskia River is pumped from the river into Farina Lake to stabilize flows for the drinking water system. IEPA explained that both waterbodies are treated as one integrated system. For the Skillet Creek TMDL, IEPA noted that water is pumped from Skillet Fork into the Wayne City Reservoir, where it is used for the drinking water system. In this situation, IEPA determined that a separate atrazine load would be determined for Skillet Creek and Wayne City Reservoir.

Table 1. Atrazine/Simazine TMDL waterbodies

Waterbody	Segment ID #	Pollutant	Previous TMDL	Previous pollutants addressed
Lake Carlinville	RDG	Atrazine	Macoupin River/Lake Carlinville	Manganese, Phosphorus
Salem City Reservoir	ROR	Simazine	Crooked Creek	Manganese, Phosphorus
Nashville City Reservoir	ROO	Atrazine, Simazine	Crooked Creek	Manganese, Phosphorus
Washington County Lake	RNM	Atrazine, Simazine	Beaucoup Creek	Phosphorus
Farina Lake*	SOB	Simazine	East Fork Kaskaskia River	Manganese, Fecal coliform
Lake Mattoon	RCF	Simazine	Little Wabash River	Phosphorus
Lake Paradise	RCG	Simazine	Little Wabash River	Phosphorus
Wayne City Reservoir	RCT	Atrazine	Skillet Fork	Manganese
Shoal Creek	OI-08	Atrazine	Shoal Creek	Manganese, Fecal coliform
Skillet Fork	CA-05	Atrazine	Skillet Fork	Manganese, Fecal coliform
North Fork Vermilion River	BPG-05	Atrazine	North Fork Vermilion River	Nitrates

* - includes a segment of the East Fork Kaskaskia River (OK 03)

Table 2 Location of the Atrazine/Simazine waterbodies

Waterbody	Location	
Lake Carlinsville	Macoupin County,	impoundment of Honey Creek
Salem City Reservoir	Marion County	impoundment of Town Creek
Nashville City Reservoir	Washington County	impoundment of Nashville Creek
Washington County Lake	Washington County	impoundment of Locust Creek
Farina Lake	Fayette and Marion Counties	impoundment of East Fork Kaskaskia River
Lake Mattoon	Coles, Cumberland and Shelby Counties	impoundment of Little Wabash River
Lake Paradise	Coles, Cumberland and Shelby Counties	impoundment of Little Wabash River (upstream of Lake Mattoon)
Shoal Creek	Clinton, Bond and Montgomery Counties	
Skillet Fork/Wayne City Reservoir	Wayne, Clay, Marion and Jefferson Counties	Skillet Fork water pumped into Wayne City Reservoir
North Fork Vermilion River	Vermilion and Iroquois Counties	

Table 3 Atrazine/Simazine TMDL waterbody characteristics

Waterbodies	Surface area (acres)	Average depth (feet)	Maximum depth (feet)	Maximum storage (acre-feet)	Normal storage (acre-feet)	Watershed area (acres)
Lake Carlinsville	168	9	17	1,467		15481
Salem City Reservoir	74	10.4	14	900	388	2582
Nashville City Reservoir	42	9.5	12.4	701	400	1007
Washington County Lake	242	13		4232	1404	6188
Farina Lake	4.5		30		108	2903
Lake Mattoon	1010	10.5	35	22,569	11,820	35140
Lake Paradise	176	7.5	19	2834	1350	11494
Wayne City Reservoir*	8	15		201	167	
Shoal Creek						477,000
Skillet Fork/Wayne City Reservoir						387,000
North Fork Vermilion River						149,000

* - lake-specific data

Distribution of land use: The land use for the waterbodies is mainly agricultural in nature, with most of the agricultural land use in row crop (corn/soybean). Rural grasslands and upland forest make up most of the remaining land use (Section 4.1 of each of the TMDLs). Table 4 of this Decision Document contains the land use for the waterbodies.

Table 4 Land use percentage in the Atrazine/Simazine TMDL waterbodies

Waterbody	Agricultural lands	Rural grasslands	Upland forest	Developed	other
Lake Carlenville	65	5	22	1	7
Salem City Reservoir	65		14	6	15
Nashville City Reservoir	81	1	7	7	4
Washington County Lake	64	3	22	5	6
Farina Lake	77			20	3
Lake Mattoon	77		5	7	11
Lake Paradise	77		5	7	11
Shoal Creek	66	3	21	10	
Skillet Fork/Wayne City Reservoir	56	13	25	6	
North Fork Vermilion River	88		5	7	

Population and future growth trends: The population for each of the lake watersheds is fairly small, less than 10,000 people. As the land use in the watersheds is mainly row crop agricultural in nature with little or no urbanization, IEPA does not expect any future growth in the watersheds.

Pollutants of concern: The TMDL submittals state the pollutants addressed in these thirteen TMDLs are atrazine and/or simazine (Table 1 of this Decision Document). Table 5 of this Decision Document lists the exceedances of atrazine and/or simazine.

Table 5 Water quality exceedances in the Atrazine/Simazine TMDL waterbodies

Waterbody	Raw water exceedances	Finished water exceedances	Raw water quarterly exceedances
Lake Carlenville	6 exceedances/84 total samples	16/91	
Salem City Reservoir	1/6		
Nashville City Reservoir	2/22	0/22	
Washington County Lake			
Farina Lake	28/119	30/119	
Lake Mattoon	16/97	14/97	
Lake Paradise			
Shoal Creek			1 quarterly exceedance
Skillet Fork/Wayne City Reservoir	17/61		4 quarterly exceedances
North Fork Vermilion River	11/101	5/101	

Sources: Atrazine and simazine are widely used herbicides, used in particular on corn to control broadleaf and grassy weeds. It is sprayed on crops during the spring and summer months, where it is absorbed into weeds and stops photosynthesis. It generally breaks down in soil, but moisture delays the degradation. The half-life of atrazine in soils is about 146 days and the half-life of simazine is about 91 days. In water, atrazine has a half-life of 742 days, and simazine has a half-life of 664 days. Although there are strict requirements for usage, atrazine and simazine can still wash off the plants and soil during rain events and enter local waterbodies. This runoff can be

exacerbated by agricultural drainage tiles. Research into the health effects of atrazine and simazine is ongoing, but they are regulated contaminants under the Safe Drinking Water Act. IEPA determined that the source of atrazine and simazine for all the waterbodies is nonpoint runoff from agricultural fields, and that none of the point sources in the watersheds are a source of atrazine and simazine.

Priority Ranking: Since these waterbodies are used as drinking water sources, these TMDLs have been given a high priority ranking by IEPA.

EPA finds that the TMDL document submitted by IEPA satisfies all requirements concerning this first element.

2. Description of the Applicable Water Quality Standards and Numeric Water Quality Target

The TMDL submittal must include a description of the applicable State/Tribal water quality standard, including the designated use(s) of the waterbody, the applicable numeric or narrative water quality criterion, and the antidegradation policy. (40 C.F.R. §130.7(c)(1)). EPA needs this information to review the loading capacity determination, and load and wasteload allocations, which are required by regulation.

The TMDL submittal must identify a numeric water quality target(s) - a quantitative value used to measure whether or not the applicable water quality standard is attained. Generally, the pollutant of concern and the numeric water quality target are, respectively, the chemical causing the impairment and the numeric criteria for that chemical (e.g., chromium) contained in the water quality standard. The TMDL expresses the relationship between any necessary reduction of the pollutant of concern and the attainment of the numeric water quality target. Occasionally, the pollutant of concern is different from the pollutant that is the subject of the numeric water quality target (e.g., when the pollutant of concern is phosphorus and the numeric water quality target is expressed as Dissolved Oxygen (DO) criteria). In such cases, the TMDL submittal should explain the linkage between the pollutant of concern and the chosen numeric water quality target.

Comment:

Designated Use/Standards: Section 4 of each of the TMDLs states that the waterbodies are drinking water sources and are not meeting the Public and Food Processing Water Supplies designation. The applicable water quality standards (WQS) for these waterbodies are established in Illinois Administrative Rules Title 35, Environmental Protection; Subtitle C, Water Pollution; Chapter I, Pollution Control Board; Part 302, Water Quality Standards, Subpart C for Public and Food Processing Water Supplies.

IEPA does not have an in-stream criterion for atrazine. The Maximum Contaminant Level (MCL) for atrazine is 3 µg/L and for simazine is 4 µg/L. The MCLs apply to finished water (i.e., water that has been treated and is ready for consumption) and is based upon a rolling 4-quarter average. Since there is only limited removal of atrazine or simazine from raw water, IEPA uses an assessment guideline for raw water to determine impairment of the Public and Food Processing Water Supplies use. Since atrazine and simazine are used in the spring and summer months, a rolling spring-summer quarterly average is used, and is compared to the

MCL. In addition, any exceedence greater than 4 times the MCL (i.e., 12 µg/L for atrazine) will also indicate an impairment (Section 4 of the TMDLs).

Target: The water quality target for atrazine for these TMDLs is **3 µg/L**, and for simazine is **4 µg/L**. These targets apply to either the finished water (end of pipe) or as a quarterly average for raw water.

EPA finds that the TMDL document submitted by IEPA satisfies all requirements concerning this second element.

3. Loading Capacity - Linking Water Quality and Pollutant Sources

A TMDL must identify the loading capacity of a waterbody for the applicable pollutant. EPA regulations define loading capacity as the greatest amount of a pollutant that a water can receive without violating water quality standards (40 C.F.R. §130.2(f)).

The pollutant loadings may be expressed as either mass-per-time, toxicity or other appropriate measure (40 C.F.R. §130.2(i)). If the TMDL is expressed in terms other than a daily load, e.g., an annual load, the submittal should explain why it is appropriate to express the TMDL in the unit of measurement chosen. The TMDL submittal should describe the method used to establish the cause-and-effect relationship between the numeric target and the identified pollutant sources. In many instances, this method will be a water quality model.

The TMDL submittal should contain documentation supporting the TMDL analysis, including the basis for any assumptions; a discussion of strengths and weaknesses in the analytical process; and results from any water quality modeling. EPA needs this information to review the loading capacity determination, and load and wasteload allocations, which are required by regulation.

TMDLs must take into account *critical conditions* for stream flow, loading, and water quality parameters as part of the analysis of loading capacity. (40 C.F.R. §130.7(c)(1)). TMDLs should define applicable *critical conditions* and describe their approach to estimating both point and nonpoint source loadings under such *critical conditions*. In particular, the TMDL should discuss the approach used to compute and allocate nonpoint source loadings, e.g., meteorological conditions and land use distribution.

Comment:

Loading capacity: The loading capacities were calculated for each of the waterbodies, and are found in Section 6 of the TMDL documents and Table 4 below.

Lakes:

For the lakes listed in Table 1 of this Decision Document, the process used to determine the loading capacity for atrazine and simazine was a simple loading capacity calculation. The volume of each lake was multiplied by the target for atrazine (3 µg/L) or simazine (4 µg/L) to calculate the loading capacity of the lake. For example, the Lake Mattoon loading capacity was calculated using the equation below:

Load Capacity = maximum storage (7335 MG) x 0.0004 mg/L simazine x 2.2 lbs/kg x 3.785 L/gal

After converting the units, the loading capacity is 245 lbs. Table 8 of this Decision Document shows the lake volume used for each lake and the resulting lake loading capacity.

Table 6 Atrazine/Simazine Lake TMDL Summary

	Lake Carlinville	Salem City Reservoir	Nashville City Reservoir	Washington County Lake	Farina Lake	Lake Mattoon	Lake Paradise	Wayne City Reservoir
Maximum lake storage (MG)*	478 MG	293 MG	228 MG	1379 MG	35 MG	7355 MG	924 MG	53.4
Load allocation	atrazine	12 lbs/d	**	5.7 lbs/d	34 lbs/d	**	**	1.3 lbs/d
	simazine	**	9.8 lbs/d	7.6 lbs/d	46 lbs/d	1.2 lbs/d	245 lbs/d	31 lbs/d

Margin of Safety (MOS)	Implicit							
Loading capacity (maximum)	atrazine	12 lbs/day	**	5.7 lbs/d	34 lbs/d	**	**	**
	simazine	**	9.8 lbs/d	7.6 lbs/d	46 lbs/d	1.2 lbs/d	245 lbs/d	31 lbs/d
Estimated reduction from existing loads	74.9%	55%	79% atrazine 76% simazine	79% atrazine 76% simazine	43%	52%	52%	70%

* MG = million gallons

** - no TMDL

Rivers:

For the rivers listed in Table 1 of this Decision Document, IEPA calculated loads based upon the in-stream atrazine concentrations. The concentration (mg/L), multiplied by the flow (mgd) and the standard conversion factor of (8.34), resulted in loads of atrazine (Page 19 of the TMDL). These loads were then compared to the load based upon the WQS of 3 µg/L (Tables 7, 9, 11 below). The needed reduction was calculated for each impaired river. The TMDL is based upon the atrazine criteria of 3 µg/L; the loads depend upon the waterbodies flows as noted below. IEPA calculated loads using the load duration curve process (USEPA, 2007), and Purdue University Web-Based calculation tool (refer to: <https://engineering.purdue.edu/wldc/>). The data used for the load duration curve calculation is presented in Appendix A of this report. To clarify the loading capacity presented in the report (Table 8 of the TMDLs), the EPA is providing calculations in Table 8 demonstrating what the loading capacity is at additional river flows. This is also repeated for the other two river TMDLs (Tables 10 and 12).

Table 7 North Fork Vermilion River Atrazine TMDL summary

Critical condition:

The critical condition for atrazine was identified as the spring/summer growing season, based upon analysis of the sampling data. This would correspond to the time period when application of atrazine to the farm fields would occur.

EPA finds that the TMDL document submitted by IEPA satisfies all requirements concerning this third element.

4. Load Allocations (LAs)

EPA regulations require that a TMDL include LAs, which identify the portion of the loading capacity attributed to existing and future nonpoint sources and to natural background. Load allocations may range from reasonably accurate estimates to gross allotments (40 C.F.R. §130.2(g)). Where possible, load allocations should be described separately for natural background and nonpoint sources.

Comment:

The LAs for the waterbodies are found in Tables 6, 7, 9, and 11 of this Decision Document. Since IEPA determined there are no point sources of atrazine or simazine, all the loading capacity was allocated to the load allocation. The source of atrazine in the two watersheds is nonpoint source runoff from row crop agricultural fields.

EPA finds that the TMDL document submitted by IEPA satisfies all requirements concerning this fourth element.

5. Wasteload Allocations (WLAs)

EPA regulations require that a TMDL include WLAs, which identify the portion of the loading capacity allocated to individual existing and future point source(s) (40 C.F.R. §130.2(h), 40 C.F.R. §130.2(i)). In some cases, WLAs may cover more than one discharger, e.g., if the source is contained within a general permit.

The individual WLAs may take the form of uniform percentage reductions or individual mass based limitations for dischargers where it can be shown that this solution meets WQSs and does

not result in localized impairments. These individual WLAs may be adjusted during the NPDES permitting process. If the WLAs are adjusted, the individual effluent limits for each permit issued to a discharger on the impaired water must be consistent with the assumptions and requirements of the adjusted WLAs in the TMDL. If the WLAs are not adjusted, effluent limits contained in the permit must be consistent with the individual WLAs specified in the TMDL. If a draft permit provides for a higher load for a discharger than the corresponding individual WLA in the TMDL, the State/Tribe must demonstrate that the total WLA in the TMDL will be achieved through reductions in the remaining individual WLAs and that localized impairments will not result. All permittees should be notified of any deviations from the initial individual WLAs contained in the TMDL. EPA does not require the establishment of a new TMDL to reflect these revised allocations as long as the total WLA, as expressed in the TMDL, remains the same or decreases, and there is no reallocation between the total WLA and the total LA.

Comment:

IEPA stated there are no known point sources of atrazine in the watersheds. The WLA is 0 for all of the atrazine/simazine TMDLs.

EPA finds that the TMDL document submitted by IEPA satisfies all requirements concerning this fifth element.

6. Margin of Safety (MOS)

The statute and regulations require that a TMDL include a margin of safety (MOS) to account for any lack of knowledge concerning the relationship between load and wasteload allocations and water quality (CWA §303(d)(1)(C), 40 C.F.R. §130.7(c)(1)). EPA's 1991 TMDL Guidance explains that the MOS may be implicit, i.e., incorporated into the TMDL through conservative assumptions in the analysis, or explicit, i.e., expressed in the TMDL as loadings set aside for the MOS. If the MOS is implicit, the conservative assumptions in the analysis that account for the MOS must be described. If the MOS is explicit, the loading set aside for the MOS must be identified.

Comment:

IEPA uses an implicit MOS for the atrazine/simazine TMDLs. The MOS is provided within the TMDL calculation. The ultimate goal of these TMDLs is to reduce the levels of atrazine/simazine in drinking water.

In addition to the reduction of atrazine/simazine into the waterbodies, atrazine/simazine can be partially removed from raw drinking water as part of the drinking water treatment process. Several of the drinking water facilities (i.e., Carlinville, Mattoon) use activated carbon to remove/reduce atrazine/simazine in finished water. This treatment process will be used until attainment of the TMDL reductions and the raw water atrazine levels attain the TMDL goals. Thus, basing the TMDL on meeting the atrazine MCL in raw water prior to treatment, should ensure that the MCL is met following treatment. In addition, the atrazine/simazine loads are likely overestimated based upon the procedure used to assess drinking water use (rolling quarterly average) as compared to the concentration times flow loading calculation. An average by definition includes values above and below the final average value. IEPA applied the WQS

for atrazine and simazine as “not to exceed” values, which is more restrictive when calculating load reductions.

EPA finds that the TMDL document submitted by IEPA has an appropriate implicit MOS satisfying all requirements concerning this sixth element.

7. Seasonal Variation

The statute and regulations require that a TMDL be established with consideration of seasonal variations. The TMDL must describe the method chosen for including seasonal variations. (CWA §303(d)(1)(C), 40 C.F.R. §130.7(c)(1)).

Comment:

The sampling data shows that exceedences occur in the spring and summer, when atrazine/simazine are applied in the fields. IEPA properly accounted for seasonality for the TMDLs by using the spring-summer rolling average in calculating the TMDL, when atrazine and simazine values are at their highest, and exceedences most common.

EPA finds that the TMDL document submitted by IEPA satisfies all requirements concerning this seventh element.

8. Reasonable Assurances

When a TMDL is developed for waters impaired by point sources only, the issuance of a National Pollutant Discharge Elimination System (NPDES) permit(s) provides the reasonable assurance that the wasteload allocations contained in the TMDL will be achieved. This is because 40 C.F.R. 122.44(d)(1)(vii)(B) requires that effluent limits in permits be consistent with “the assumptions and requirements of any available wasteload allocation” in an approved TMDL.

When a TMDL is developed for waters impaired by both point and nonpoint sources, and the WLA is based on an assumption that nonpoint source load reductions will occur, EPA’s 1991 TMDL Guidance states that the TMDL should provide reasonable assurances that nonpoint source control measures will achieve expected load reductions in order for the TMDL to be approvable. This information is necessary for EPA to determine that the TMDL, including the load and wasteload allocations, has been established at a level necessary to implement water quality standards.

EPA’s August 1997 TMDL Guidance also directs Regions to work with States to achieve TMDL load allocations in waters impaired only by nonpoint sources. However, EPA cannot disapprove a TMDL for nonpoint source-only impaired waters, which do not have a demonstration of reasonable assurance that LAs will be achieved, because such a showing is not required by current regulations.

Comment:

Section 9 of the TMDL documents discusses the reasonable assurance. Reasonable assurance does not strictly apply to the atrazine/simazine TMDLs, as there are no point sources

contributing to the impairment. However, IEPA provided information on potential controls of atrazine that will be targeted to the watersheds.

Atrazine is a restricted use pesticide, which can only be applied by certified applicators. The Illinois Department of Agriculture (IDA) administers the certification process, which includes training and testing for both private and commercial applicators. IDA maintains a list of best management practices (BMPs) for the use of atrazine/simazine to minimize the runoff and loss.

All of the waterbodies have TMDLs already approved for other pollutants, mainly total phosphorus (TP) and fecal coliform. Many of the BMPs for controlling TP and fecal coliform will also help control atrazine and simazine. For all these pollutants, controlling field runoff is critical to reduce pollutant loading into the waterbodies. Such BMPs as no-till cultivation, buffer strips, and riparian buffers will slow water movement and allow TP, fecal coliform, and atrazine/simazine to either settle out or degrade before entering a waterbody.

As noted previously in the Margin of Safety section of this Decision Document, the ultimate goal of these TMDLs is to reduce the levels of atrazine and simazine in drinking water. As part of the drinking water treatment process, atrazine can be partially removed from raw drinking water. In 2012, the maker of atrazine, Syngenta, settled a lawsuit regarding atrazine in numerous drinking water sources in the Midwest. (Section 7 of the TMDLs). A Settlement Fund of \$15 million was set up for Illinois water suppliers that were part of the class-action suit. These funds are available for water systems to upgrade water treatment systems.

EPA finds that this criterion has been adequately addressed.

9. Monitoring Plan to Track TMDL Effectiveness

EPA's 1991 document, *Guidance for Water Quality-Based Decisions: The TMDL Process* (EPA 440/4-91-001), recommends a monitoring plan to track the effectiveness of a TMDL, particularly when a TMDL involves both point and nonpoint sources, and the WLA is based on an assumption that nonpoint source load reductions will occur. Such a TMDL should provide assurances that nonpoint source controls will achieve expected load reductions and, such TMDL should include a monitoring plan that describes the additional data to be collected to determine if the load reductions provided for in the TMDL are occurring and leading to attainment of water quality standards.

Comment:

The TMDL submittals contain discussion on future monitoring (Section 7.3 of the TMDLs). Monitoring will occur as part of the drinking water program, which requires quarterly monitoring of finished water. Although not required, raw water is also monitored by the drinking water systems, to determine the necessary level of treatment. IEPA also monitors the lakes at least every three years to determine if the lakes are meeting the Public and Food Processing Water Supply use.

EPA finds that this criterion has been adequately addressed.

10. Implementation

EPA policy encourages Regions to work in partnership with States/Tribes to achieve nonpoint source load allocations established for 303(d)-listed waters impaired by nonpoint sources. Regions may assist States/Tribes in developing implementation plans that include reasonable assurances that nonpoint source LAs established in TMDLs for waters impaired solely or primarily by nonpoint sources will in fact be achieved. In addition, EPA policy recognizes that other relevant watershed management processes may be used in the TMDL process. EPA is not required to and does not approve TMDL implementation plans.

Comment:

A summary of potential implementation activities are in the TMDL submittals. IEPA has already developed implementation plans for TP and fecal coliform for these waterbodies from previous TMDL efforts. As discussed previously, many of these BMPs will address atrazine and simazine as well. IEPA provided a number of programs that could be used to address the reductions needed, primarily through support of BMPs to control TP and TSS. These include the Clean Water Act Section 319 grants. Numerous programs administered by the US Department of Agriculture are also available, including the Conservation Reserve Program (CRP), Wetlands Reserve Program (WRP), and Environmental Quality Incentive Program (EQIP). IEPA provided the contacts for various local offices that administer the programs.

EPA reviews, but does not approve, implementation plans. EPA finds that this criterion has been adequately addressed.

11. Public Participation

EPA policy is that there should be full and meaningful public participation in the TMDL development process. The TMDL regulations require that each State/Tribe must subject calculations to establish TMDLs to public review consistent with its own continuing planning process (40 C.F.R. §130.7(c)(1)(ii)). In guidance, EPA has explained that final TMDLs submitted to EPA for review and approval should describe the State's/Tribe's public participation process, including a summary of significant comments and the State's/Tribe's responses to those comments. When EPA establishes a TMDL, EPA regulations require EPA to publish a notice seeking public comment (40 C.F.R. §130.7(d)(2)).

Provision of inadequate public participation may be a basis for disapproving a TMDL. If EPA determines that a State/Tribe has not provided adequate public participation, EPA may defer its approval action until adequate public participation has been provided for, either by the State/Tribe or by EPA.

Comment:

The public comment period for the draft TMDLs opened on the dates as listed in Table 13 of this Decision Document. In general, the public comment periods were held in late 2013 and early 2014. Public meetings were held for all the draft TMDLs, on the dates listed below. The public notices were published in local newspapers as appropriate, and interested individuals and organizations received copies of the public notice. A hard copy of the TMDLs were made available at public locations in the TMDL watershed (i.e., local library, City Hall), and was also

available upon request. The draft TMDLs were also made available at the website <http://www.epa.state.il.us/water/tmdl/>.

Table 13 Public notice dates

TMDL	Public Notice period	Public Meeting date
Lake Carlinville	September 10-October 10, 2013	September 10, 2013
Salem City Reservoir	September 19-Oct. 21, 2013	September 19, 2013
Nashville City Reservoir	October 16 – Nov. 15, 2013	October 16, 2013
Washington County Lake	October 16 – Nov. 15, 2013	October 16, 2013
Farina Lake/ East Fork Kaskaskia River	November 7-Dec 9, 2013	November 7, 2013
Lake Mattoon	September 26 - October 30, 2013	September 26, 2013
Lake Paradise	September 26 - October 30, 2013	September 26, 2013
Shoal Creek	November 19-Dec. 19, 2013	November 19, 2013
Skillet Fork/ Wayne City Reservoir	January 28-February 28, 2014	January 28, 2014
North Fork Vermillion River	November 6-Dec 6, 2013	November 6, 2013

Comments were submitted by Syngenta and the Illinois Farm Bureau (IFB) on all of the TMDLs. Most of the Syngenta comments were technical in nature, and involved the adequacy of the sampling data or the health risks from atrazine. The IFB comments were also similar for each waterbody, and concerned how existing BMPs were considered in the TMDL.

Syngenta: Syngenta questioned the accuracy of the MCL for atrazine, and questioned how the MCL was developed. IEPA stated that the MCL is not only set by the State but also by the EPA, and that there are more appropriate venues to update MCLs. Several questions were raised regarding the amount and age of the atrazine sampling data, and that the data used in the TMDL did not reflect current conditions in the waterbodies. IEPA responded that the TMDLs used the latest data available that had been reviewed for quality assurance procedures. IEPA also noted that data from 2012 was informally reviewed, and did not indicate a change in the impairment status of the waterbodies. Syngenta also noted that the MOS was actually extremely high, based upon numerous conservative assumptions in the frequency of exceedence criterion, single sample concentration loading criterion, average of exceedences, and rounding of results, as well as the inherent safety factor incorporated by the USEPA in the development of the MCL. IEPA noted that the MCL is not subject to change in the TMDL, and other avenues are available for pursue a change in the MCL. As cited by both IEPA and Syngenta, there is ongoing work by the USEPA Drinking Water program, as well as atrazine and simazine reregistration by the USEPA. Additional information is also available from the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA), as well as the Scientific Advisory Panel, atrazine and simazine toxicity from the Agency for Toxic Substances and Disease Registry (ATSDR) and atrazine and simazine studies by the United States Geological Survey.

IFB: Comments were also received from the IFB questioning whether implementation activities that were developed after the 2007 approval of the existing TMDLs were accounted for in the atrazine and simazine TMDLs. The IFB requested IEPA assess the impacts of the various phosphorus and sediment BMPs used in the watersheds, and include the effects of these BMPs on atrazine and simazine loads to determine if the TMDLs were actually needed. IEPA noted that several BMPs have been implemented in the watersheds, and were discussed in the TMDL documents. IEPA also noted that while these BMPs should have an impact on atrazine and

simazine levels in the waterbodies, the impacts cannot be quantified until the next assessment cycle, and therefore the TMDLs will proceed.

EPA carefully reviewed the comments and IEPA's responses, and finds that IEPA appropriately addressed the submitted comments. EPA finds that the TMDL document submitted by IEPA satisfies all requirements concerning this eleventh element.

12. Submittal Letter

A submittal letter should be included with the TMDL submittal, and should specify whether the TMDL is being submitted for a *technical review* or *final review and approval*. Each final TMDL submitted to EPA should be accompanied by a submittal letter that explicitly states that the submittal is a final TMDL submitted under Section 303(d) of the Clean Water Act for EPA review and approval. This clearly establishes the State's/Tribe's intent to submit, and EPA's duty to review, the TMDL under the statute. The submittal letter, whether for technical review or final review and approval, should contain such identifying information as the name and location of the waterbody, and the pollutant(s) of concern.

Comment:

On September 9, 2015, EPA received the Illinois atrazine/simazine TMDLs as noted in Table 1 of this Decision Document, and a submittal letter. In the submittal letter, IEPA stated it was submitting the TMDL reports for EPA's final approval. The submittal letter included the names and locations of the waterbodies and the pollutants of concern.

EPA finds that the TMDL document submitted by IEPA satisfies all requirements concerning this twelfth element.

Conclusion

After a full and complete review, EPA finds that the TMDLs for the waters listed in Table 1 of this Decision Document satisfy all of the elements of approvable TMDLs. This approval is for a total of thirteen atrazine and/or simazine TMDLs for eleven waterbodies (eight lakes and three rivers).

EPA's approval of this TMDL does not extend to those waters that are within Indian Country, as defined in 18 U.S.C. Section 1151. EPA is taking no action to approve or disapprove TMDLs for those waters at this time. EPA, or eligible Indian Tribes, as appropriate, will retain responsibilities under the CWA Section 303(d) for those waters.

 Appendix A. Responsiveness Summary

EXECUTIVE SUMMARY

The objective of this draft report is to provide information that will be used to support a Total Maximum Daily Load (TMDL) development process for simazine in Salem City Reservoir watershed.

Background

Section 303(d) of the 1972 Clean Water Act requires States to define impaired waters and identify them on a list which is referred to as the 303(d) list. The State of Illinois recently issued the 2012 303(d) list, which is available on the web at: <http://www.epa.state.il.us/water/tmdl/303d-list.html>. Section 303(d) of the Clean Water Act and EPA's Water Quality Planning and Management Regulations (40 CFR Part 130) require states to develop Total Maximum Daily Loads (TMDLs) for water bodies that are not meeting designated uses under technology-based controls. The Clean Water Act requires that a TMDL be completed for each pollutant listed for an impaired waterbody. A TMDL is a report that is submitted by the States to the EPA.

TMDL Process

The TMDL process establishes the allowable loading of pollutants or other quantifiable parameters for a water body based on the relationship between pollution sources and instream conditions. This allowable loading represents the maximum quantity of the pollutant that the waterbody can receive without exceeding water quality standards. The TMDL also takes into account a margin of safety, which reflects scientific uncertainty, as well as the effects of seasonal variation. By following the TMDL process, States can establish water quality-based controls to reduce pollution from both point and nonpoint sources, and restore and maintain the quality of their water resources (USEPA, 1991).

The Illinois EPA will be working with stakeholders to implement the necessary controls to improve water quality in the impaired waterbodies and meet water quality standards. It should be noted that the controls for nonpoint sources (e.g., agriculture) will be strictly voluntary.

Methods

The information presented in this report was gathered from previously approved TMDL Report (2008 Report) for the watershed, and includes: 1) collection of information for detailed watershed characterization; 2) development of a water quality database and data analyses; and 3) synthesis of the watershed characterization information and the data analysis results to confirm the sufficiency of the data to support both the listing decision and the sources of impairment that are included on the 2012 303(d) list of impaired waterbodies.

Results

Based on work completed to date, Illinois EPA has concluded that TMDL is warranted for Salem City Reservoir to address simazine impairment in the watershed as discussed below:

- For **Salem City Reservoir (ROR)**, data are sufficient to support the causes listed on the 2012 303(d) list for simazine and a TMDL is warranted. Potential sources of simazine impairment include agricultural runoff, and crop production.

Section 1. Goals and Objectives for Salem City Reservoir Watershed

1.1 Total Maximum Daily Load (TMDL) Overview

A Total Maximum Daily Load, or TMDL, is a calculation of the maximum amount of a pollutant that a water body can receive and still meet water quality standards. TMDLs are a requirement of Section 303(d) of the Clean Water Act (CWA). To meet this requirement, the Illinois Environmental Protection Agency (Illinois EPA) must identify water bodies not meeting water quality standards and then establish TMDLs for restoration of water quality. Illinois EPA lists water bodies not meeting water quality standards every two years. This list is called the 303(d) list and water bodies on the list are then targeted for TMDL development.

In general, a TMDL is a quantitative assessment of water quality problems, contributing sources, and pollution reductions needed to attain water quality standards. The TMDL specifies the amount of pollution or other stressor that needs to be reduced to meet water quality standards, allocates pollution control or management responsibilities among sources in a watershed, and provides a scientific and policy basis for taking actions needed to restore a water body.

Water quality standards are laws or regulations that states authorize to enhance water quality and protect public health and welfare. Water quality standards provide the foundation for accomplishing two of the principal goals of the CWA. These goals are:

- Restore and maintain the chemical, physical, and biological integrity of the nation's waters
- Where attainable, to achieve water quality that promotes protection and propagation of fish, shellfish, and wildlife, and provides for recreation in and on the water

Water quality standards consist of three elements:

- The designated beneficial use or uses of a water body or segment of a water body
- The water quality criteria necessary to protect the use or uses of that particular water body
- An antidegradation policy

Examples of designated uses are recreation and protection of aquatic life. Water quality criteria describe the quality of water that will support a designated use. Water quality criteria can be expressed as numeric limits or as a narrative statement. Antidegradation policies are adopted so that water quality improvements are conserved, maintained, and protected.

1.2 TMDL Goals and Objectives for Salem City Reservoir Watershed

The Illinois EPA has a three-stage approach to TMDL development. The stages are:

- Stage 1 – Watershed Characterization, Data Analysis, Methodology Selection

- Stage 2 – Data Collection (optional)
- Stage 3 – TMDL Analysis, TMDL Scenarios, Implementation Plan

The impaired water body in the watershed is Salem City Reservoir (ROR). This impaired water body segment is shown on Figure 1. Table 1 lists the water body ID, water body size, and potential causes of impairment for the water body (IEPA 2012).

Table 1. Impairments in Salem City Reservoir

Water Body ID	Water Body Name	Size	Causes of Impairment with Numeric Standards/ MCL	Causes of Impairment with Assessment Guidelines
ROR	Salem City Reservoir	74 acres	Dissolved Oxygen*, Manganese*, pH, Simazine Total phosphorus*	Aquatic Algae, Mercury, Total Suspended Solids (TSS)

*TMDLs are approved for these parameters

^Although not on the 2012 IR, data will be used to list it on the Final 2014 IR Report

This TMDL applies to bold parameters only

A previous TMDL for dissolved oxygen, manganese and total phosphorus was approved in August of 2008. The final TMDL for the Crooked Creek Watershed is available at <http://www.epa.state.il.us/water/tmdl/report/crooked-creek/crooked-creek.pdf>. Information from the approved TMDL was used for this TMDL. This current TMDL report will focus on simazine. Simazine has been listed in the 2012 Integrated Report (IR) as a potential cause of impairment in Salem City Reservoir (IEPA 2012).

The TMDL for the segment listed above will specify the following elements:

- Loading Capacity (LC) or the maximum amount of pollutant loading a water body can receive without violating water quality standards
- Waste Load Allocation (WLA) or the portion of the TMDL allocated to existing or future point sources
- Load Allocation (LA) or the portion of the TMDL allocated to existing or future nonpoint sources and natural background
- Margin of Safety (MOS) or an accounting of uncertainty about the relationship between pollutant loads and receiving water quality

These elements are combined into the following equation:

$$\text{TMDL} = \text{LC} = \Sigma\text{WLA} + \Sigma\text{LA} + \text{MOS}$$

The TMDL developed must also take into account the seasonal variability of pollutant loads so that water quality standards are met during all seasons of the year. An allowance for increased simazine loading (reserve capacity) was not included in this TMDL. Salem City Reservoir is a drinking water source and simazine is a chemical of concern; therefore, it is unlikely that changes to Salem City Reservoir would result in an increased assimilative capacity of the lake. Reasonable assurance that the TMDL will be achieved is described in the implementation plan.

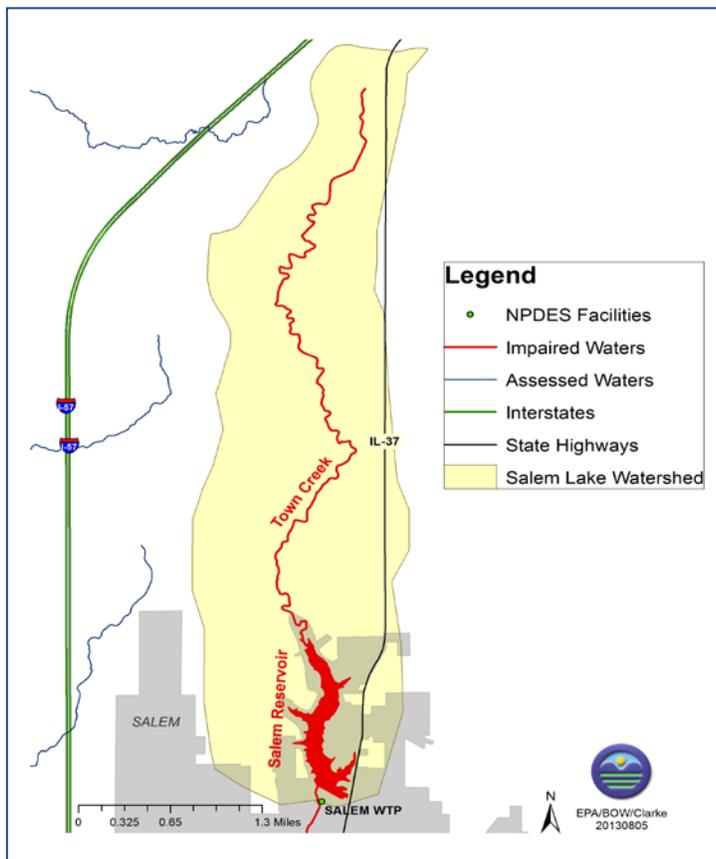

The implementation plan for Salem City Reservoir watershed describes how water quality standards will be attained. This implementation plan includes recommendations for implementing best management practices (BMPs) and cost estimates.

Section 2. Salem City Reservoir Watershed Description

2.1 Salem City Reservoir Watershed Location

Salem City Reservoir watershed (Figure 1) is located in south central Illinois, trends in a southern direction, and drains approximately 2,582 acres within the state of Illinois. The watershed covers land within Marion County.

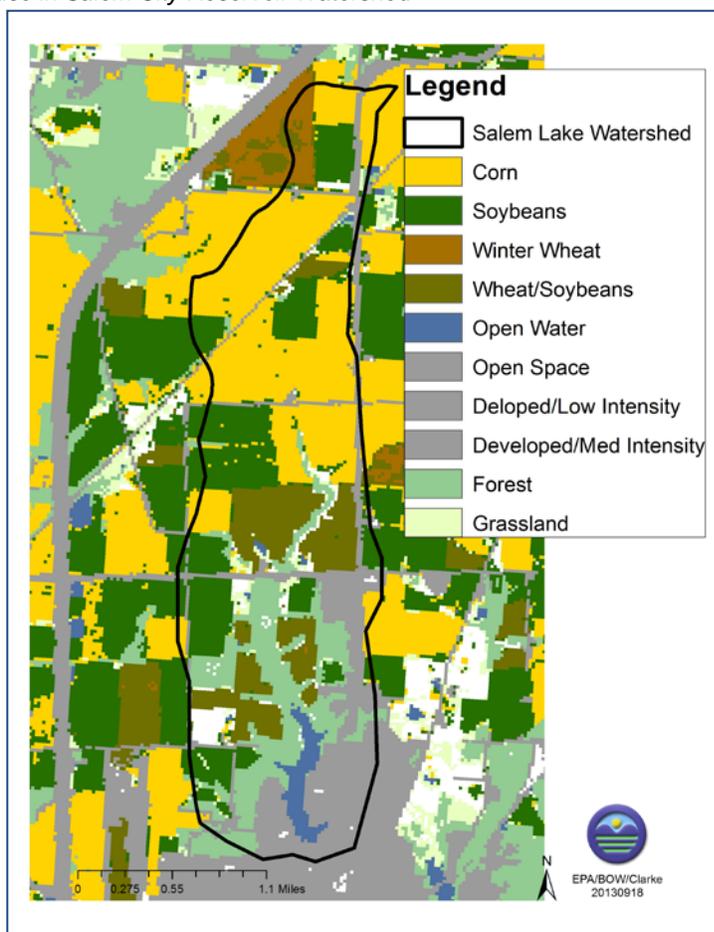

Figure 1. Salem City Reservoir Watershed

2.2 Land Use

Landcover information(Figure 2.) is from the 2013 Illinois Cropland Data layer produced by the USDA National Agricultural Statistics Service (http://www.nass.usda.gov/research/Cropland/metadata/metadata_ill11.htm). The land cover data reveal that approximately 65 percent are devoted to agricultural activities. Other land uses include forest (14%), open space (10%), developed (6%), surface water (2%) and other (3%) (see Figure 2).

Figure 2. Landuse in Salem City Reservoir Watershed

Tillage practices can be categorized as conventional till, reduced till, mulch-till, and no-till. The percentage of each tillage practice for corn, soybeans, and small grains by county are generated by the Illinois Department of Agriculture from County Transect Surveys. The most recent survey with county statistics was conducted in 2004 (IDOA 2004). Data specific to Salem City Reservoir watershed were not available; however, the Marion County practices were available and are shown in the following table.

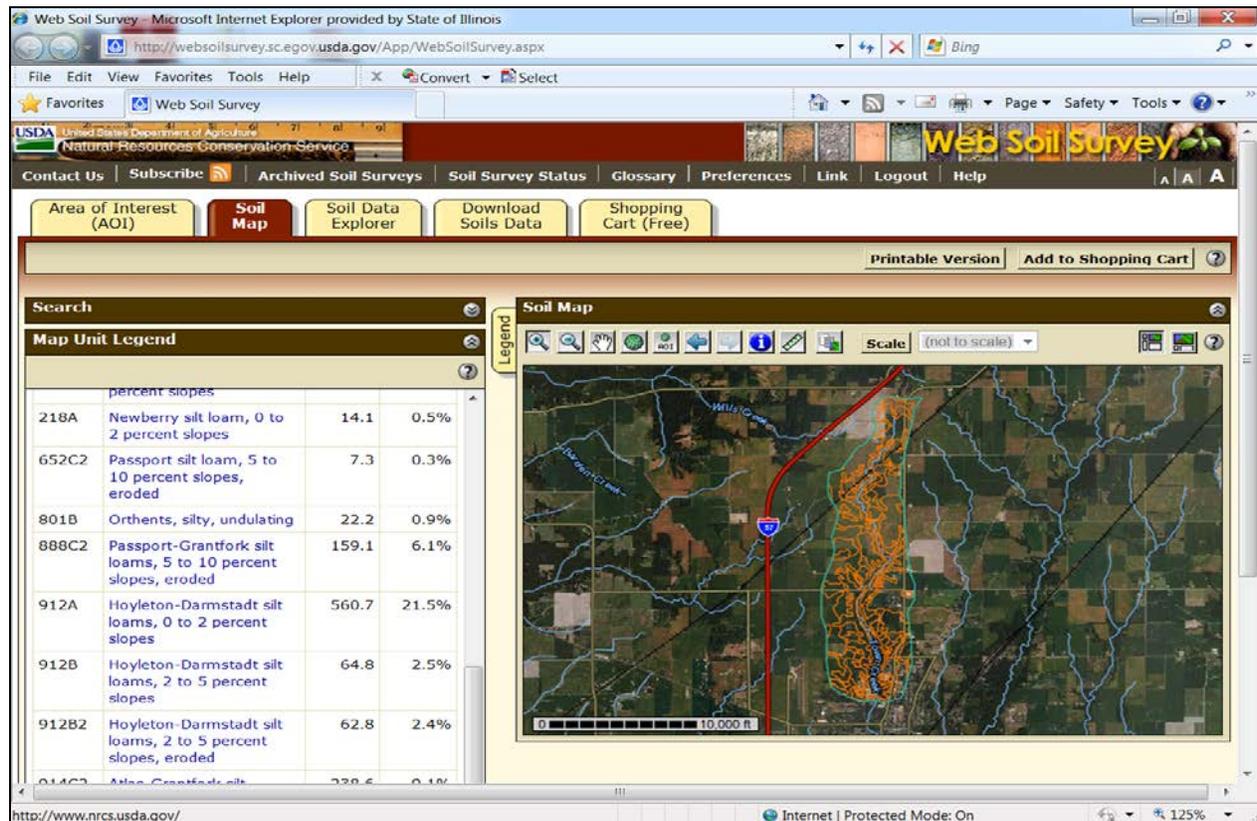

Table 2. Tillage Practices in Marion County

Tillage System	Corn	Soybean	Small Grain
Conventional	85%	21%	80%
Reduced - Till	3%	10%	0%
Mulch - Till	1%	17%	4%
No - Till	11%	51%	16%

2.4 Soils

Soil information is from the USDA NRCS Web Soil Survey (WSS) that is available online at <http://websoilsurvey.sc.egov.usda.gov/App/HomePage.htm> (Figure 3). The major soils types are: Hoyleton Darmstadt silt loam (912A), 0-2 percent slopes (22%); Cisne silt loam (2A), 0-2 percent slope (17%) and Cisne Huey silt loam (991A), 0-2 percent slopes (16%). Figure 4 is a zoomed in maps of the watershed which lists the soil type symbols. All soils are poorly drained with a low water capacity. They are listed as moderately susceptible on the site degradation susceptibility summary. This rates each soil for its susceptibility for soil degradation to occur during disturbance. Most of the moderately susceptible soils are in the agricultural areas.

Figure 3. Soil Map of the Salem City Reservoir Watershed using the WSS Website

Section 4. Salem City Reservoir Watershed Water Quality Standards

4.1 Illinois Water Quality Standards

Attainment of public and food processing water supply use is assessed only in waters in which the use is currently occurring, as evidenced by the presence of an active public-water-supply intake. The assessment of public and food processing water supply use is based on conditions in both untreated and treated water. By incorporating data through programs related to both the federal Clean Water Act and the federal Safe Drinking Water Act, Illinois EPA believes that these guidelines provide a comprehensive assessment of public and food processing water supply use.

Assessments of public and food processing water supply use recognize that characteristics and concentrations of substances in Illinois surface waters can vary and that a single assessment guideline may not protect sufficiently in all situations. Using multiple assessment guidelines helps improve the reliability of these assessments. When applying these assessment guidelines, Illinois EPA also considers the water-quality substance, the level of treatment available for that substance, and the monitoring frequency of that substance in the untreated water. See Table 3 for IEPA assessment guidelines.

Degree of Use Support	Guidelines
Fully Supporting (Good)	<p>For each substance in <u>untreated</u> water ⁽¹⁾, for the most-recent three years of readily available data or equivalent dataset,</p> <p>a) \leq 10% of observations exceed an applicable Public and Food Processing Water Supply Standard ⁽²⁾; and b) for which the concentration is not readily reducible by conventional treatment,</p> <p>i) no observation exceeds by at least fourfold the <u>treated</u>-water Maximum Contaminant Level threshold concentration ⁽³⁾ for that substance; and</p> <p>ii) no quarterly average concentration exceeds the <u>treated</u>-water Maximum Contaminant Level threshold concentration ⁽³⁾ for that substance; and</p> <p>iii) no running annual average concentration exceeds the <u>treated</u>-water Maximum Contaminant Level threshold concentration ⁽⁴⁾ for that substance.</p> <p>and ⁽⁴⁾,</p> <p>For each substance in treated water, no violation of an applicable Maximum Contaminant Level ⁽³⁾ occurs during the most recent three years of readily available data.</p>
Not Supporting (Fair)	<p>For any single substance in <u>untreated</u> water, ⁽¹⁾ for the most-recent three years of readily available data or equivalent dataset,</p> <p>a) $>$ 10% of observations exceed a Public and Food Processing Water Supply Standard ⁽²⁾; or</p> <p>b) for which the concentration is not readily reducible by conventional treatment,</p> <p>i) at least one observation exceeds by at least fourfold the <u>treated</u>-water Maximum Contaminant Level threshold concentration ⁽³⁾ for that substance; or</p> <p>ii) the quarterly average concentration exceeds the <u>treated</u>-water Maximum Contaminant Level threshold concentration ⁽³⁾ for that substance; or</p> <p>iii) the running annual average concentration exceeds the <u>treated</u>-water Maximum Contaminant Level threshold concentration ⁽³⁾ for that substance.</p> <p>or,</p> <p>For any single substance in <u>treated</u> water, at least one violation of an applicable Maximum Contaminant Level ⁽³⁾ occurs during the most recent three years of readily available data.</p>

Table 3. Guidelines for Assessing Public Water Supply in Waters of the State (IEPA 2012)

One of the assessment guidelines for untreated water relies on a frequency-of-exceedance threshold (10%) because this threshold represents the true risk of impairment better than does a single exceedance of a water quality criterion. Assessment guidelines also recognize situations in which water treatment that consists only of “...*coagulation, sedimentation, filtration, storage and chlorination, or other equivalent treatment processes*” (35 Ill. Adm. Code 302.303; hereafter called “conventional treatment”) may be insufficient for reducing potentially harmful levels of some substances. To determine if a Maximum Contaminant Level (MCL) violation in treated water would likely occur if treatment additional to conventional treatment were not applied (see 35 Ill. Adm. Code 302.305), the concentration of the potentially harmful substance in untreated water is examined and compared to the MCL threshold concentration. If the concentration in untreated water exceeds an MCL-related threshold concentration, then an MCL violation could reasonably be expected in the absence of additional treatment.

Compliance with an MCL for treated water is based on a running 4-quarter (i.e., annual) average, calculated quarterly, of samples collected at least once per quarter (Jan.-Mar., Apr.-Jun., Jul.-Sep., and Oct.-Dec.). However, for some untreated-water intake locations, sampling occurs less frequently than once per quarter; therefore, statistics comparable to quarterly averages or running 4-quarter averages cannot be determined for untreated water. Rather, for substances not known to vary regularly in concentration in Illinois surface waters (untreated) throughout the year, a simple arithmetic average concentration of all available results is used to

compare to the MCL threshold. For substances known to vary regularly in concentration in surface waters during a typical year (e.g., simazine), average concentrations within the relevant sub-annual (e.g., quarterly) periods are used.

Table 4 presents the MCL for the cause of impairment for Salem City Reservoir. EPA has set an enforceable regulation for simazine at 0.004 mg/L or 4µg/L. The MCLs are from 35 Ill. Adm. Code 611, Subpart F: MCLs and Maximum Residual Disinfectant Levels (MRDLs). The MCL is the highest level of a contaminant that is allowed in drinking water. MCLs are set as close as feasible to the maximum contaminant level goals (MCLGs) using the best available treatment technology. If a facility exceeds the MCL, the facility must immediately investigate treatment options to reduce the level of the contaminant in the water supply. The MCLG is the level of a contaminant in drinking water below which there is no known or expected risk to human health. Some people who drink water containing simazine well in excess of the MCL for many years could experience problems with their blood. For more information see the EPA website at <http://water.epa.gov/drink/contaminants/basicinformation/simazine.cfm#three>.

After sub-chronic and chronic exposure to simazine, a variety of species were shown to exhibit neuroendocrine effects resulting in both reproductive and developmental consequences that are considered relevant to humans (USEPA 2006). The toxic mode of action involves central nervous system (CNS) toxicity (suppression of the luteinizing hormone surge prior to ovulation resulting in prolonged estrus in adult female rats (USEPA 2013). Because the database for simazine's potential neuroendocrine effects is less robust than the atrazine database, particularly for the young, the EPA concluded that atrazine data could be used as bridging data for simazine due to the fact that simazine and atrazine share the neuroendocrine mechanism of toxicity and that these neuroendocrine effects are considered the primary toxicological effects of regulatory concern for the relevant exposure durations (USEPA 2006).

Table 4. MCL for Salem City Reservoir Impairment

Parameter	Units	Public and Food Processing Water Supplies
Simazine	µg/L	4 µg/L (Maximum Contaminant Level)

µg/L = micrograms per liter

4.2 Designated Uses

The waters of Illinois are classified by designated uses, which include: General Use, Public and Food Processing Water Supplies, Lake Michigan, and Secondary Contact and Indigenous Aquatic Life Use. The designated use applicable to the Salem City Reservoir Watershed is the Public and Food Processing Water Supplies Use. Drinking water for the City of Salem is supplied by the Salem community water supply (CWS). Carlyle Lake and the Salem City Reservoir serve as the source of this water. Facilities that purchase water from Salem include NE Marion County Water Company, Odin and Raccoon Water Company (IEPA 2001).

The Public and Food Processing Water Supplies Use is defined by IPCB as standards that "are cumulative with the general use standards of Subpart B and must be met in all waters designated in Part 303 at any point at which water is withdrawn for treatment and distribution as a potable supply or for food processing."

4.3 Potential Pollutant Sources

In order to properly address the conditions within Salem City Reservoir watershed, potential pollution sources must be investigated for the pollutants where TMDLs will be developed. Table 5 shows the potential source associated with the listed cause for the 303(d) listed segment in this watershed.

Table 5. Summary of Potential Sources for Salem City Reservoir Watershed

Segment ID	Segment Name	Potential Causes	Potential Sources
ROR	Salem City Reservoir	Simazine	Crop production

Section 5. Salem City Reservoir Watershed Characterization

Data were collected and reviewed from many sources in order to further characterize Salem City Reservoir watershed. Data has been collected in regards to water quality, reservoirs, and both point and nonpoint sources. This information is presented and discussed in further detail in the remainder of this section.

5.1 Water Quality Data

IEPA Water quality data from station ROR-1 was analyzed for simazine. Data is summarized by impairment and discussed in relation to the maximum contaminant level (Table 6 and 7).

Table 6. Inventory of IEPA Data for Salem City Reservoir

ROR-1	Period of Record	Number of Samples	Exceedences
Simazine	April- October 2010	6	1

The maximum contaminant level for simazine is 4 ug /L. One of the six samples exceeded the MCL for simazine. Table 7 contains data from IEPA.

Table 7. Simazine Data at Station ROR-1

Station Code	Analyte	Collection Date	Sample Medium	Result	Units
ROR-1	Simazine	27-Apr-10	Water	9.1	ug/l
ROR-1	Simazine	04-Jun-10	Water	3.2	ug/l
ROR-1	Simazine	24-Jun-10	Water	2.3	ug/l
ROR-1	Simazine	23-Jul-10	Water	0.65	ug/l
ROR-1	Simazine	18-Aug-10	Water	0.43	ug/l
ROR-1	Simazine	28-Oct-10	Water	0.14	ug/l

Illinois EPA assessment for public water supply use considers both the raw and finished water quality data for the last three years of available data. No more than 10 percent of the raw water samples exceed the MCL or there can be no exceedences of the MCL for the quarterly average concentration. For the finished water, no sample can be over the MCL. For Salem City Reservoir, only raw water samples are taken by IEPA. Drinking water compliance data was also taken into account. There are no exceedences in finished water.

5.2 Reservoir Characteristics

Salem City Reservoir is an impoundment of Town Creek. The Creek flows approximately 3.5 miles before entering Salem City Reservoir. The lake was originally constructed in 1912.

Table 8. Salem City Reservoir Dam information (U.S. Army Corps)

Salem City Reservoir is located in the northern part of the City of Salem in Marion County. The lake has a surface area of 74 acres. The City of Salem is supplied by the Salem Community Water Supply, which draws from Carlyle Lake and Salem City Reservoir. Table 8 shows Salem City Reservoir dam information. The average maximum water depth is 10.4 feet (IEPA 2008).

Dam Length	775 feet
Dam Length	21 feet
Maximum Discharge	3,000 cfs
Maximum Storage	900 acre-feet
Normal Storage	388 acre-feet
Spillway Width	60 feet
Outlet Gate Type	U

5.3 Point Sources

Permitted facilities must provide Discharge Monitoring Reports (DMRs) to Illinois EPA as part of their NPDES permit compliance. DMRs contain effluent discharge sampling results that are then maintained in a database by the state. There is one point source located south of the Salem City Reservoir. Figure 1 shows the permitted facility that discharges downstream of the lake. Table 9 contains a summary of available DMR data for this point source. It is assumed that this facility does not use simazine and is not a source.

Table 9. Effluent Data from Point Sources in the Salem City Reservoir Watershed

Facility Name Permit Number	Receiving Water	Constituent	Average Value	Loading (lb/d)
Salem Water Treatment Plant ILG640031	Town Creek/ south of Salem City Reservoir	Average Daily Flow	0.039 mgd	NA

5.4 Nonpoint Sources

Simazine is a systemic herbicide that is usually applied to soil, absorbed through leaves and roots and acts by inhibiting photosynthesis within the plant. It is widely used as a selective herbicide to control most annual grasses and broadleaf weeds. Simazine is used on corn crops, forestry sites, turf grass and weed control on places such as industrial sites and highway medians. An estimated 5 to 7 million pounds are applied to agricultural crops with about 2 million applied to corn in the Midwest (USEPA 2006). The approximate half-life in the environment is 91 days but in water the half-life is 664 days (USEPA 2006). It is highly mobile in water and has low absorption into soils. Refer to section 6.2 for pollutant sources and linkages.

5.5 Watershed Planning Information

In 2000, the City installed a destratifier and large fountain in the lake to treat the lake for algal problems (IEPA 2006). In 2002, the City obtained funding from the 319 Source Program and Conservation 2000 that funded spillway repair and stabilization of 300 feet of shoreline at Salem Reservoir. In 2005, the City spent \$6,000 on rip rap on parts of the lake (IEPA 2006). The IEPA Volunteer Water Quality Monitoring Program received lake monitoring data from 1981 until 2006.

Figure 5. Salem City Water Treatment Plant

Section 6. TMDL Development

6.1 TMDL Calculations

TMDL simazine loads are based on the simazine MCL of 0.004 mg/L. Maximum capacity of the lake is 900 acre feet or 293 MG.

6.2 Pollutant Sources and Linkages

Simazine is a chlorinated triazine herbicide, a class of herbicides that includes atrazine and propazine pesticides. For purposes of estimating risks, simazine is assumed to be equivalent in toxicity to atrazine (USEPA 2013). Simazine is used for selective control of broadleaf weeds in crops, specifically corn for this watershed. Refer to Section 5.4 for more information on simazine and atrazine.

Transport mechanisms include overland runoff, discharge from drainage tiles. No known point sources of simazine occur within the watershed and point source discharges of simazine are assumed not to occur. According to the 2011 Illinois Cropland Data layer produced by the USDA National Agricultural Statistics Service (http://www.nass.usda.gov/research/Cropland/metadata/metadata_ill11.htm), 28% of the crops in the Salem City Reservoir watershed are corn. Water from Salem City Reservoir is used for human consumption. This water is impaired for public water supply use with simazine as a pollutant.

6.3 TMDL Allocations for Salem City Reservoir

As explained in Section 1, the TMDLs for Salem City Reservoir address the following equation:

$$\text{TMDL} = \text{LC} = \Sigma\text{WLA} + \Sigma\text{LA} + \text{MOS}$$

where

LC	=	Maximum amount of pollutant loading a water body can receive without violating water quality standards
WLA	=	The portion of the TMDL allocated to existing or future point sources
LA	=	Portion of the TMDL allocated to existing or future nonpoint sources and natural background
MOS	=	An accounting of uncertainty about the relationship between pollutant loads and receiving water quality

Each of these elements will be discussed in this section as well as consideration of seasonal variation in the TMDL calculation.

Loading Capacity

The loading capacity (LC) of the waterbody is the amount of simazine that can be allowed in the lake and still meet the water quality standard of 0.004 mg/L simazine. The allowable simazine loads that can be generated in the watershed and still maintain water quality standards were determined to be 9.8 pounds at full storage capacity. The storage capacity is 293 million gallons. Using conversion factors, the loads were calculated. If there are any levels of simazine beyond the 0.004 mg/L in the lake samples, this will exceed the maximum storage capability of 7.3 lb/day at normal storage.

Loading Capacity= Maximum Storage: 293 MG * 0.004 mg/l simazine * 2.2 lb/mg * 3.785 l/gal = 9.8 lb simazine

Seasonal Variation

A season is represented by changes in weather; for example, a season can be classified as warm or cold as well as wet or dry. Since the pollutant source can be expected to contribute loadings in different quantities during different time periods (e.g., various portions of the growing season resulting in different runoff characteristics), the loadings for this TMDL will focus both on normal and maximum storage. Simazine runoff from upstream is expected in spring and early summer when flows are higher. This critical period corresponds with normal to maximum water levels.

Margin of Safety

A margin of safety (MOS) is required in a TMDL to account for uncertainty about the relationship between pollutant loads and attainment of water quality standards. The margin of safety (MOS) can be implicit (incorporated into the TMDL analysis through conservative assumptions) or explicit (expressed in the TMDL as a portion of the loadings).

The Illinois EPA public water supply assessment methodology guidelines takes into account the water-quality substance, the level of treatment provided for finished water (conventional treatment, per 35 Ill. Adm. Code 302.303) for that substance, and the monitoring frequency of that substance in the untreated water, and this approach provides a conservative assumption for the implicit margin of safety. To determine if a Maximum Contaminant Level (MCL) violation in treated water would likely occur if treatment additional to conventional treatment were not applied (see 35 Ill. Adm. Code 302.305), the concentration of the potentially harmful substance in untreated water is examined and compared to the MCL threshold concentration (IEPA 2014). With this conservative approach, lower levels of simazine in raw water will reduce the cost of extra treatment in finished water.

The MOS for the Salem City Reservoir TMDL is implicit. The load calculation is based on exceedances during the months of June and July when exceedances were highest. This timeframe represents the critical condition when runoff and exceedances of atrazine are likely to occur. The source of atrazine, which is an herbicide applied onto agricultural land, is known

with certainty. The implementation plan contains best management practices for source reductions.

Additional MOS is provided by how the TMDL is calculated. The loading capacity is calculated as the lake volume multiplied by the MCL of 0.004 mg/L which results in the daily load of simazine. However, the public water supply assessment process uses a rolling annual average of quarterly samples for raw water (as does the EPA for finished water compliance). Use of an average will by definition have some values above the mean. By using the daily load calculation, the TMDL loading capacity is more protective.

Waste Load Allocation

There are no point sources within the Salem City Reservoir watershed that discharge simazine. Therefore, the waste load allocation (WLA) was set to zero for this TMDL.

Load Allocation and TMDL Summary

Table 10 shows a summary of the TMDL for Salem City Reservoir. On average, a total reduction of 55 percent of simazine load to Salem City Reservoir would result in compliance with the water quality standard of 0.004 mg/L simazine. The 55 percent reduction would need to come from nonpoint sources. The current load was calculated using data from Table 7. The average of the exceeded simazine values for the raw water is 9 micrograms per liter or 0.009 mg/L.

Table 10. TMDL Summary for Salem City Reservoir

TMDL	Load Source	LC (lb/day)	WLA (lb/day)	LA (lb/day)	MOS (lb/day)	Current Load (lb/day)	Reduction Needed (lb/day)	Reduction Needed (percent)
Simazine	Capacity	9.8	0	9.8	Implicit	22	12.2	55

Section 7. Implementation Plan for Salem City Reservoir

According to the TMDL summary in Table 9, there needs to be a 55 percent reduction of simazine in the lake. Implementation actions, management measures, or best management practices (BMPs) in the watershed are used to control the generation or distribution of pollutants. BMPs are either structural, such as filter strips; or managerial, such as conservation tillage, public outreach and education. The remainder of this section will discuss implementation actions and management measures for simazine sources in the watershed.

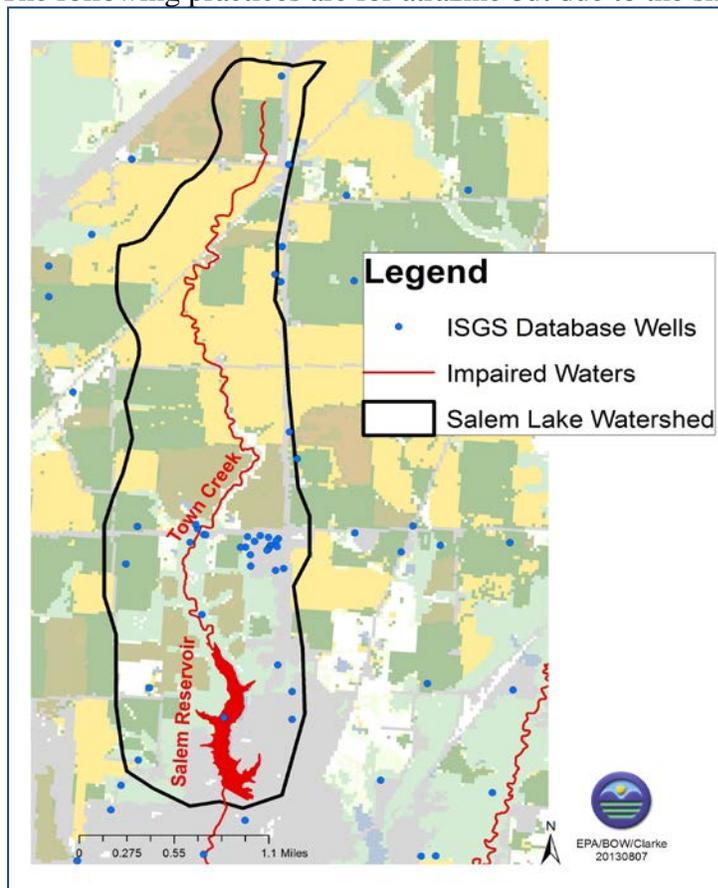

7.1 Nonpoint Sources of Simazine

Simazine is applied to agricultural land, specifically corn in this watershed. Surface runoff and tile drainage deliver simazine to the lake. BMPs evaluated that could be utilized to treat these nonpoint sources are careful pesticide application practices and controlling runoff. Fields closer to surface water can be targeted for BMPs. Another option is filtering water at the treatment plant.

Pesticide Application Practices

Information on application practices is taken from the pesticide label- <http://www.turf.uiuc.edu/teaching/NRES300/labels/princep.pdf>. Simazine is applied before weeds emerge or after removal of weed growth. Lower rates should be used on coarse textured soil and soil lower in organic matter, high rates on fine-textured soils and soils with higher organic matter. To avoid spray drift, it should not be applied in windy conditions. Do not apply directly to water or to areas where surface water is present. Do not contaminate water by cleaning of equipment or disposal of wastes. Simazine is a chemical which can travel through soil and enter ground water which may be used as a drinking water. Users of this product are advised not to apply simazine where the water table (ground table) is close to the surface and where the soils are very permeable, i.e., well-drained soils such as loamy soils. Users are advised to consult with their local agricultural agencies to obtain information on the location of ground water and the type of soil in their area.

The following practices are for atrazine but due to the similar effects of simazine to atrazine,

these practices can be applied to both. Delay herbicide application if heavy rain is forecast. Pesticides are most susceptible to runoff during the first several hours after application. Atrazine/ simazine is highly soluble in water and applications should be delayed as long as the soils are saturated and more rain is predicted (Purdue 2004). Atrazine/ simazine should not be applied within 50 feet of abandoned/current wells, drainage wells or sinkholes. This applies to drinking water wells, irrigation wells, livestock water wells, abandoned wells and agricultural drainage wells. Figure 6 displays the wells in the Lake watershed. Sinkholes refer to surface depressions that permit direct runoff

of surface water into groundwater. Atrazine/ simazine should not be applied within 66 feet of the points where field surface water runoff enters streams or rivers. This applies to both perennial and intermittent streams. The USGS topographic maps show perennial streams as solid blue lines and intermittent streams as dashed blue lines. You should not apply within 200 feet around a lake or reservoir. Filter strips are recommended around lakes. Atrazine/ simazine should not be mixed or loaded within 50 feet of any waterbody. Also, atrazine/ simazine cannot be applied within 66 feet of a tile inlet in terraced fields unless it is incorporated and or greater than 30 percent residue is present. A 66 foot filter strip is recommended around the outlet.

Controlling Runoff

Leaving crop residue on the fields and No-till agriculture can reduce pesticide runoff over conventional tillage. The residue slows the movement of water across the field and can increase infiltration. According to county wide statistics, almost half of the corn crops are farmed conventionally. Changing from conventional to no- till will have a reduction in erosion and phosphorus for the watershed. So this practice could not only reduce phosphorus and total suspended solids, but simazine also. This practice has the lowest costs of any practice in the watershed. Other practices to control runoff are terraces, contour farming and grade stabilization. Also allowing soils to dry before tilling or other operations can help reduce compaction and allow better infiltration.

Conservation practices such as buffers and riparian corridors can be used to control runoff. The ground has the filtering capacity to drain water and absorb simazine. Buffers implemented along stream segments and around waterbodies slow and filter nutrients, pesticides and sediment out of runoff. Greater biological activity in a soil improves its ability to effectively deal with pesticides and pollutants, and that is more prevalent in a soil rich in plant roots and organisms (Grismer 2006). A recent study in Iowa indicated a 28 to 35 percent removal for the pesticide atrazine for a 15-foot long filter, compared to a 51 to 60 percent removal for a 30-foot filter (Leed et al 1994).

Riparian buffers, including both the stream channel and adjacent land areas, are important components of watershed ecology. Preserving natural vegetation along stream corridors and around waterbodies can effectively reduce water quality degradation associated with development. The root structure of the vegetation in a buffer enhances infiltration of runoff and subsequent trapping of nonpoint source pollutants. However, the buffers are only effective in this manner when the runoff enters the buffer as a slow moving, shallow "sheet;" concentrated flow in a ditch or gully will quickly pass through the buffer offering minimal opportunity for retention and uptake of pollutants.

Table 11. Filter Strip Flow Lengths Based on Land Slope

Percent Slope	0.5%	1.0%	2.0%	3.0%	4.0%	5.0% or greater
Minimum (feet)	36	54	72	90	108	117
Maximum (feet)	72	108	144	180	216	234

Table 11 above outlines the guidance for filter strip flow length by slope (NRCS 1999). There are areas within the watershed that could be converted to buffer strips. Landowners and property managers should evaluate the land near tributaries and surrounding the lakes and consider installation of filter strips according to the NRCS guidance. Programs available to fund the construction of these filter strips are discussed in Section 7.2. According to the atrazine label, atrazine (simazine) should not be applied within 66 feet of where field surface water runoff enters streams or rivers or within 50 feet of a waterbody. Using GIS, a buffer can be geoprocessed around the stream shapefile. Figure 6 is an example of using the buffer tool in the Salem City Reservoir watershed to put a 66 foot buffer around an NHD streams. This buffer area could be used as a filter strip or riparian corridor.

Figure 7. Buffer Strip Around NHD Stream Coverage Using ArcGIS Geoprocessing Tool

Buffers also provide streambank protection along with their filtering capacity. This is relevant to this waterbody since it is impaired for phosphorus and total suspended solids, for which a TMDL was developed (IEPA 2007). The rooting systems of the vegetation serve as reinforcements in streambank soils, which help to hold streambank material in place and minimize erosion. Due to the increase in stormwater runoff volume and peak rates of runoff associated with agriculture and development, stream channels are subject to greater erosional forces during stormflow events. Thus, preserving natural vegetation along stream channels minimizes the potential for water quality and habitat degradation due to streambank erosion and enhances the pollutant removal of sheet flow runoff from developed areas that passes through the buffer. The increased organic matter in these corridors should increase degradation of atrazine/simazine.

Converting land adjacent to waterbodies for the creation of riparian buffers will provide stream bank stabilization, stream shading, and nutrient uptake and trapping from adjacent areas. Minimum buffer widths of 25 feet are required for water quality benefits. Higher removal rates are provided with greater buffer widths. Riparian corridors typically treat a maximum of 300 feet of adjacent land before runoff forms small channels that short circuit treatment. In addition to the treated area, any land converted from agricultural land has the potential to reduce the amount of atrazine/simazine needed. Figure 8 and 9 show erosion prone areas and buffer strips in the watershed.

The following information is taken from a the website- *The Value of Buffers for Pesticide Stewardship and Much More*

(<http://pesticidestewardship.org/Documents/Value%20of%20Buffers.pdf>).

Permanent within-field buffers include grassed waterways, contour buffer strips and wind buffers. Grassed waterways are strategically placed where they intercept the water and slow it down, thus preventing gully and rill erosion. Contour buffer strips are planted to perennial vegetation alternated with cultivated strips and placed along the contour. These reduce the risk of concentrated flow, gully erosion and pesticide runoff. Wind buffers are a single or multiple rows of trees to protect crops from winds. They can also reduce pesticide drift and reduce runoff if they are planted dense enough. Wind buffers can also consists of tall grasses planted in thin rows perpendicular to prevailing winds.

Permanent edge-of-field buffers include field borders, filter strips and riparian forest buffers. Field borders are permanent perennial vegetation established on the edge of a crop field. It reduces the movement of pesticides and nutrients, traps eroding soils and reduces pesticide drift. Filter strips are areas of grass or other permanent vegetation located between crop field and a body of water and intended to reduce runoff. Riparian forest buffers are areas planted in trees and shrubs and located adjacent to waters.

Constructed wetlands provide additional benefits when implemented in combination with buffers. In fields that are tile drained, runoff bypasses buffers and may deliver subsurface drainage directly to streams. Wetlands can effectively degrade pesticides and denitrify nitrates when strategically located at tile outlets.

Figure 8. Erosion Prone Areas

Figure 9. Buffer Strips in Watershed

Treatment Plant Upgrade

Removal of simazine and atrazine at the water treatment plant requires expensive chemical absorption procedures. Filters with activated carbon are used to absorb the simazine and atrazine. At most water plants, sand filters are used because they are cheaper and last longer, but they do not remove organics such as PCBs, pharmaceuticals and pesticides.

The Aquilla Water Supply District began additional treatment to remove atrazine by installing a powder-activated carbon hopper at the water treatment plant in 1999. This system came at a cost of \$434,169. Information on the Aquilla Water Supply District is taken from the Implementation Plan for the TMDL for Atrazine in Aquilla Reservoir (TNRCC 2002). At the Ohio Bowling Green water plant, they have a granular activated carbon (GAC) pressure system. They have twelve GAC vessels and change out six vessels each year at a cost of \$117,000. Total costs for installation was 4.5 million in the year 2000.

Atrazine Reduction Success Stories

Following high atrazine levels in 1994, the local watershed committee for Lake Springfield encouraged practices such as buffer zones of plants and vegetation along stream banks, taking farmland out of production, rotating corn and soybeans and improved chemical-application practices. The treatment plant spent more than \$600,000 on powdered activated carbon from 1994 to 2003 to reduce atrazine. The yearly amount for treatment has decreased since atrazine levels in the watershed have decreased. The Lake Springfield Watershed Resources Planning Committee is made up of water treatment plant staff, farmers, conservation and environmental advocates, business people and lake residents.

Atrazine Settlement Fund

On May 30, 2012, District Judge J. Phil Gilbert of the United States District Court for the Southern District of Illinois approved a \$105 million class-action settlement the City of Greenville brought against Syngenta Crop Protection, Inc., and Syngenta AG (collectively, Syngenta) for the alleged contamination of community water supplies with atrazine. Information from the settlement is available in the court order- http://www.ilsd.uscourts.gov/opinions/ilsd_live.3.10.cv.188.2065985.0.pdf. Through the agreement between the parties, a Settlement Fund was created to allocate a fixed payment to the 2,000 U.S. Community Water Systems and then allocates the remainder of the Settlement Fund on a *pro-rata* basis based on evidence of the significance of the history of atrazine detection, size, and the age of each claim. The settlement ensures that each class member receives a portion of the settlement, while providing a proportionally larger share to those who are most affected by the presence of atrazine. The Settlement Fund is intended to be used to cover the costs associated with the purchase and operation of appropriate filtration systems to properly treat atrazine. Illinois' 143 water supplies that were part of the class-action settlement received a

total of \$15 million (<http://www.huffingtonpost.com/huff-wires/20130125/us-herbicide-settlement-money/>). The \$15 million was not allocated to all Illinois water supplies to share, but that the total of each Illinois public water supply claim added up to \$15 million, per the settlement agreement. The settlement does not interfere with the jurisdiction of any regulatory agency, and it preserves any claims from future point-source contamination and off-label use. Syngenta acknowledges no liability and continues to stand by the safety of atrazine. Settlement funds have been used for water treatment plant upgrades to reduce atrazine. In one small community, the funds were used to install a water pipe to a nearby non-impaired source, which was more cost effective than a plant upgrade.

7.2 Reasonable Assurance

Reasonable assurance means that a demonstration is given that nonpoint source reductions in this watershed will be implemented. It should be noted that all programs discussed in this section are voluntary and some may currently be in practice to some degree within the watershed. The discussion in Section 7.1 provided information on suggested BMPs for nonpoint sources. The remainder of this section discusses an estimate of costs to the watershed for implementing these practices and programs available to assist with funding.

Available Cost-Share Programs

There are several voluntary conservation programs established through the 2008 U.S. Farm, which encourage landowners to implement resource-conserving practices for water quality and erosion control purposes. These programs would apply to agricultural land and rural grasslands in the watershed. In addition, Illinois EPA has grant programs that can assist in implementation of nonpoint source controls. Each program is discussed separately in the following paragraphs.

Conservation Reserve Program (CRP)

<http://www.fsa.usda.gov/FSA/webapp?area=home&subject=copr&topic=crp>

The CRP is a voluntary program for agricultural landowners. Through CRP, landowners can receive annual rental payments and cost-share assistance to establish long-term, resource conserving covers on eligible farmland.

The Commodity Credit Corporation (CCC) makes annual rental payments based on the agriculture rental value of the land, and it provides cost-share assistance for up to 50 percent of the participant's costs in establishing approved conservation practices. Participants enroll in CRP contracts for 10 to 15 years.

CRP protects millions of acres of American topsoil from erosion and is designed to safeguard natural resources. By reducing water runoff and sedimentation, CRP protects groundwater and helps improve the condition of lakes, rivers, ponds, and streams. Acreage enrolled in the CRP is planted to resource-conserving vegetative covers, making the program a major contributor to increased wildlife populations in many parts of the country.

The Farm Service Agency (FSA) administers CRP, while technical support functions are provided by NRCS, USDA's Cooperative State Research, Education, and Extension Service, State forestry agencies, local soil and water conservation districts, and private sector providers of technical assistance. Producers can offer land for CRP general sign-up enrollment only during designated sign-up periods. Environmentally desirable land devoted to certain conservation practices may be enrolled at any time under CRP continuous sign-up. Certain eligibility requirements still apply, but offers are not subject to competitive bidding. Further information on CRP continuous sign-up is available in the FSA fact sheet "Conservation Reserve Program Continuous Sign-up."

To be eligible for placement in CRP, land must be either:

- Cropland (including field margins) that is planted or considered planted to an agricultural commodity 4 of the previous 6 crop years, and which is physically and legally capable of being planted in a normal manner to an agricultural commodity; or
- Certain marginal pastureland that is suitable for use as a riparian buffer or for similar water quality purposes.

In addition to the eligible land requirements, cropland must meet one of the following criteria:

- Have a weighted average erosion index of 8 or higher;
- Be expiring CRP acreage; or
- Be located in a national or state CRP conservation priority area.

FSA provides CRP participants with annual rental payments, including certain incentive payments, and cost-share assistance:

- Rental Payments – In return for establishing long-term, resource-conserving covers, FSA provides annual rental payments to participants. FSA bases rental rates on the relative productivity of the soils within each county and the average dry land cash rent or cash-rent equivalent. The maximum CRP rental rate for each offer is calculated in advance of enrollment. Producers may offer land at that rate or offer a lower rental rate to increase the likelihood that their offer will be accepted.
- Maintenance Incentive Payments – CRP annual rental payments may include an additional amount up to \$4 per acre per year as an incentive to perform certain maintenance obligations.
- Cost-share Assistance – FSA provides cost-share assistance to participants who establish approved cover on eligible cropland. The cost-share assistance can be an amount not more than 50 percent of the participants' costs in establishing approved practices.
- Other Incentives – FSA may offer additional financial incentives of up to 20 percent of the annual payment for certain continuous sign-up practices.

Conservation practices eligible for CRP funding which are recommended BMPs for this watershed TMDL include but are not limited to filter strips, grass waterways, riparian buffers, wetland restoration, and tree plantings.

Clean Water Act Section 319 Grants

Section 319 was added to the CWA to establish a national program to address nonpoint sources of water pollution. Through this program, each state is allocated Section 319 funds on an annual basis according to a national allocation formula based on the total annual appropriation for the section 319 grant program. The total award consists of two categories of funding: incremental funds and base funds. A state is eligible to receive EPA 319(b) grants upon USEPA's approval of the state's Nonpoint Source Assessment Report and Nonpoint Source Management Program. States may reallocate funds through subawards (e.g., contracts, subgrants) to both public and private entities, including local governments, tribal authorities, cities, counties, regional development centers, local school systems, colleges and universities, local nonprofit organizations, state agencies, federal agencies, watershed groups, for-profit groups, and individuals.

USEPA designates incremental funds for the restoration of impaired water through the development and implementation of watershed-based plans and TMDLs for impaired waters. Base funds, funds other than incremental funds, are used to provide staffing and support to manage and implement the state Nonpoint Source Management Program. Section 319 funding can be used to implement activities which improve water quality, such as filter strips, streambank stabilization, etc.

Illinois EPA receives federal funds through Section 319(h) of the CWA to help implement Illinois' Nonpoint Source (NPS) Pollution Management Program. The purpose of the program is to work cooperatively with local units of government and other organizations toward the mutual goal of protecting the quality of water in Illinois by controlling NPS pollution. The program emphasizes funding for implementing cost-effective corrective and preventative BMPs on a watershed scale; funding is also available for BMPs on a non-watershed scale and the development of information/education NPS pollution control programs.

The Maximum Federal funding available is 60 percent, with the remaining 40 percent coming from local match. The program period is two years unless otherwise approved. This is a reimbursement program.

Section 319(h) funds are awarded for the purpose of implementing approved NPS management projects. The funding will be directed toward activities that result in the implementation of appropriate BMPs for the control of NPS pollution or to enhance the public's awareness of NPS pollution. Applications are accepted June 1 through August 1. Proposed 319 projects in TMDL watersheds receive high prioritization as long as they contain the required elements.

Environmental Quality Incentive Program (EQIP)

<http://www.il.nrcs.usda.gov/programs/eqip/index.html>

EQIP is a voluntary conservation program that provides financial and technical assistance to farmers and ranchers who face threats to soil, water, air, and related natural resources on their land. Through EQIP, the NRCS develops contracts with agricultural producers to implement conservation practices to address environmental natural resource problems. Payments are made to producers once conservation practices are completed according to NRCS requirements.

Persons engaged in livestock or agricultural production and owners of non-industrial private forestland are eligible for the program. Eligible land includes cropland, rangeland, pastureland, private non-industrial forestland, and other farm or ranch lands. Persons interested in entering into a cost-share agreement with the USDA for EQIP assistance may file an application at any time.

NRCS works with the participant to develop the EQIP plan of operations. This plan becomes the basis of the EQIP contract between NRCS and the participant. NRCS provides conservation practice payments to landowners under these contracts that can be up to 10 years in duration.

The EQIP objective to optimize environmental benefits is achieved through a process that begins with National priorities that address: impaired water quality, conservation of ground and surface water resources improvement of air quality reduction of soil erosion and sedimentation, and improvement or creation of wildlife habitat for at-risk species. National priorities include: reductions of nonpoint source pollution, such as nutrients, sediment, pesticides, or excess salinity in impaired watersheds consistent with TMDLs where available as well as the reduction of groundwater contamination and reduction of point sources such as contamination from confined animal feeding operations; conservation of ground and surface water resources; reduction of emissions, such as particulate matter, nitrogen oxides (NOx), volatile organic compounds, and ozone precursors and depleters that contribute to air quality impairment violations of National Ambient Air Quality Standards reduction in soil erosion and sedimentation from unacceptable levels on agricultural land; and promotion of at-risk species habitat conservation.

EQIP provides payments up to 75 percent of the incurred costs and income foregone of certain conservation practices and activities. The overall payment limitation is \$300,000 per person or legal entity over a 6-year period. The Secretary of Agriculture may raise the limitation to \$450,000 for projects of special environmental significance. Payment limitations for organic production may not exceed an aggregate \$20,000 per year or \$80,000 during any 6-year period for installing conservation practices.

Conservation practices eligible for EQIP funding which are recommended BMPs for this watershed TMDL include field borders, filter strips, cover crops, grade stabilization structures, grass waterways, riparian buffers, streambank shoreline protection, terraces, and wetland restoration.

The selection of eligible conservation practices and the development of a ranking process to evaluate applications are the final steps in the optimization process. Applications will be ranked based on a number of factors, including the environmental benefits and cost effectiveness of the proposal. More information regarding State and local EQIP implementation can be found at www.nrcs.usda.gov/programs/eqip.

Wildlife Habitat Incentives Program (WHIP)

<http://www.il.nrcs.usda.gov/programs/whip/index.html>

WHIP is a voluntary program for people who want to develop and improve wildlife habitat primarily on private lands and nonindustrial private forest land. It provides both technical assistance and cost share payments to help:

- Promote the restoration of declining or important native fish and wildlife species.
- Protect, restore, develop, or enhance fish and wildlife habitat to benefit at-risk species.
- Reduce the impacts of invasive species in fish and wildlife habitat.
- Protect, restore, develop, or enhance declining or impaired aquatic wildlife species habitat.

Participants who own or control land agree to prepare and implement a wildlife habitat development plan. The NRCS provides technical and financial assistance for the establishment of wildlife habitat development practices. In addition, if the landowner agrees, cooperating State wildlife agencies and nonprofit or private organizations may provide expertise or additional funding to help complete a project.

Participants work with the NRCS to prepare a wildlife habitat development plan in consultation with the local conservation district. The plan describes the participant's goals for improving wildlife habitat, includes a list of practices and a schedule for installing them, and details the steps necessary to maintain the habitat for the life of the agreement. This plan may or may not be part of a larger conservation plan that addresses other resource needs such as water quality and soil erosion.

The NRCS and the participant enter into a cost-share agreement for wildlife habitat development. This agreement generally lasts from 5 to 10 years from the date the agreement is signed for general applications and up to 15 years for essential habitat applications. Cost-share payments may be used to establish new practices or replace practices that fail for reasons beyond the participant's control.

WHIP has a continuous sign-up process. Applicants can sign up anytime of the year at their local NRCS field office. Conservation practices eligible for WHIP funding which are recommended BMPs for this watershed TMDL include but are not limited to filter strips, field borders, riparian buffers, streambank and shoreline protection, and wetland restoration.

Local Program Information

Local contact information for Macoupin County is listed in the Table 12 below. The USDA Salem Service Center is at 1550 East Main Street in Salem.

Cost Estimates of BMPs

Costs have been updated from their original sources, based on literature citations, to 2006 costs using the Engineering News Record Construction Cost Index, as provided by the Natural Resource Conservation Service (NRCS) (<http://www.economics.nrcs.usda.gov/cost/priceindexes/index.html>).

A wide range of costs has been reported for conservation tillage practices, ranging from \$12/acre to \$83/acre in capital costs (EPA, 2003). For no-till, costs per acre provided in the Illinois Agronomy Handbook for machinery and labor range from \$36 to \$66 per acre, depending on the farm size and planting methods used (UIUC, 2005). In general, the total cost per acre for machinery and labor decreases as the amount of tillage decreases and farm size increases (UIUC, 2005).

Costs of conservation buffers vary from about \$200/acre for filter strips of introduced grasses or direct seeding of riparian buffers, to approximately \$360/acre for filter strips of native grasses or planting bare root riparian buffers, to more than \$1,030/acre for riparian buffers using bare root stock shrubs (NRCS, 2005). Grassed waterways cost approximately \$1,800/acre, not including costs for tile or seeding (MCSWCD, 2006).

Illinois EQIP (<http://www.nrcs.usda.gov/PROGRAMS/EQIP/>) was used to provide filter strip and riparian buffer cost estimates. Filter strip implementation that includes seedbed preparation and native seed was estimated at \$88/acre while riparian buffers ranged from \$130/acre for herbaceous cover up to \$800/acre for forested buffers.

Table 13 summarizes the alternatives identified for the Salem City Reservoir. These alternatives should be evaluated by the local stakeholders to identify those most likely to provide the necessary load reductions, based on site-specific conditions in the watersheds. Total watershed costs will depend on the combination of BMPs selected to target non-point sources within the watershed. Regular monitoring will support adaptive management of implementation activities to most efficiently reach the TMDL goals.

Table 13. Summary of Implementation Alternatives

Alternative	Estimated Cost
Conservation Tillage	\$12 to \$83/acre
Conservation Buffers	\$200 - \$360/acre
Filter Strip- Seeded	\$88/acre
Riparian Buffer	\$130- \$800/acre
Grassed Waterways	\$1,800/acre

7.3 Monitoring Plan

The purpose of the monitoring plan for Salem City Reservoir is to assess the overall implementation of management actions outlined in this section. This can be accomplished by conducting the following monitoring programs:

- Track implementation of management measures in the watershed
- Estimate effectiveness of management measures
- Continued monitoring of Salem City Reservoir
- Storm-based monitoring of high flow events
- Tributary monitoring

Tracking the implementation of management measures can be used to address the following goals:

- Determine the extent to which management measures and practices have been implemented compared to action needed to meet TMDL endpoints
- Establish a baseline from which decisions can be made regarding the need for additional incentives for implementation efforts
- Measure the extent of voluntary implementation efforts
- Support work-load and costing analysis for assistance or regulatory programs
- Determine the extent to which management measures are properly maintained and operated

Estimating the effectiveness of the BMPs implemented in the watershed could be completed by monitoring before and after the BMP is incorporated into the watershed. Additional monitoring could be conducted on specific structural systems such as a constructed wetland. Inflow and outflow measurements could be conducted to determine site-specific removal efficiency.

Illinois EPA monitors lakes every three years and conducts Intensive Basin Surveys every five years. Continuation of this state monitoring program will assess lake water quality as improvements in the watersheds are completed. Any available future sampling data can be used to assess whether water quality standards in Salem City Reservoir are being attained.

Section 8. Acronyms and Abbreviations

BMP	Best Management Practices

Responsiveness Summary

This responsiveness summary responds to substantive questions and comments on Salem City Reservoir Simazine Total Maximum Daily Load (TMDL) Report received during the public comment period through October 21, 2013 (determined by postmark). The summary includes questions and comments from the September 19, 2013 public meeting as discussed below.

What is a TMDL?

A Total Maximum Daily Load (TMDL) is the sum of the allowable amount of a pollutant that a water body can receive from all contributing sources and still meet water quality standards or designated uses. Each contributing source of the pollutant will be assigned an amount of pollutant which it cannot exceed if the TMDL is to be met. This amount is called an "allocation." A TMDL is developed for each waterbody segment that is impaired by pollutants that have numeric water quality standards.

This TMDL is for simazine in Salem City Reservoir. The report details the watershed characteristics, impairments, pollutant sources, load allocations, and reductions for the impaired waterbody in the watershed. The Illinois EPA implements the TMDL program in accordance with Section 303(d) of the Federal Clean Water Act and regulations there under.

Background

Salem City Reservoir watershed is located in south central Illinois, trends in a southern direction, and drains approximately 2,582 acres within the state of Illinois. The watershed covers land within Marion County. The reservoir is impaired for public water supply use due to simazine. The Clean Water Act and USEPA regulations require that states develop TMDLs for waters that do not meet water quality standards and have been placed on the Section 303(d) list. The TMDL load allocations and reductions for simazine for Salem City Reservoir are presented in the report. A previous TMDL for dissolved oxygen, manganese and total phosphorus was approved in August of 2008. The final TMDL for the Crooked Creek Watershed is available at:

<http://www.epa.state.il.us/water/tmdl/report/crooked-creek/crooked-creek.pdf>.

Information from the approved TMDL was used for this TMDL. This current TMDL report will focus on simazine. Simazine has been listed in the 2012 Integrated Report (IR) as a potential cause of impairment in Salem City Reservoir (IEPA 2012).

Public Meeting

A public meeting was held at Salem City Hall at 6 p.m. on September 19, 2013. The purpose of the meeting was to provide the public with an opportunity to comment on the Atrazine TMDL and to provide additional data that may be included in the TMDL development process. The Illinois EPA announced the public notice by placing a display ad in the local newspaper in the watershed; The Salem Times-Commoner. The public notice gave the date, time, location, and purpose of the meeting. It also provided references to obtain additional information about this specific site, the TMDL Program, and other related issues. The public notice was also mailed to citizens and organizations in the watershed by first class mail. The draft TMDL Report was available for review at Salem City Hall and on the Agency's website at <http://www.epa.illinois.gov/public-notices/index>

Questions/Comments

1. Salem reservoir is not and has not been identified as being impaired for simazine in the approved 2012 or prior years 303(d) lists of impaired waters of the State of Illinois. Simazine is listed as impaired on the draft (unapproved) 2014 305(b) report. The need for preparing a simazine TMDL for Salem City Reservoir has not been established in approved Illinois EPA documents. A simazine TMDL for Salem City Reservoir should not be prepared until an approved impairment is documented.

Response: Simazine has been listed in the 2012 Integrated Report (IR) as a potential cause of impairment in Salem City Reservoir (IEPA 2012). The Clean Water Act and USEPA regulations require that states develop TMDLs for waters that do not meet water quality standards and have been placed on the Section 303(d) list.

2. The simazine TMDL is only based upon 1 of 6 samples from seven months of monitoring data from 1 year. A simazine load reduction of 55% is called for, based upon this one sample. Additional data have been submitted to IEPA that show there is no need for a Salem City Reservoir TMDL for simazine; these data are discussed and re-submitted as part of these comments.

The Simazine Registration Eligibility Decision (USEPA 2006), which was discussed multiple times in the TMDL, utilized the simazine data base to set toxicological endpoints which were not incorporated into the TMDL. Syngenta requests that these endpoints be considered when determining the need for a simazine TMDL in Salem City Reservoir.

Response: Illinois EPA assessment for public water supply use considers both the raw and finished water quality data for the last three years of data. No more than 10 percent of the raw water samples can exceed the MCL or there can be no exceedances of the MCL for the quarterly average concentration. For the finished water, no sample can be over the MCL. For this report, IEPA data from 2009 through 2011 and Syngenta's data from 2003-2010 was used for developing the TMDL load capacity for this report.

3. The simazine assessment criteria and TMDL methodology used by Illinois EPA to evaluate compliance with drinking water and the protection of human health in drinking water sources did not incorporate the endpoints adopted by the USEPA. Use of outdated and inaccurate science has led to additional large and unreasonable margins of safety in the TMDL.

The USEPA/OPP 2006 assessment concluded that 1-day (acute) simazine exposures up to 3000 ppb are not of human health concern. The Illinois EPA criterion used in developing the Salem City Reservoir TMDL sets the simazine 1-day exposure criteria at 4 ppb (based upon a lifetime MCL value).

The USEPA/OPP 2006 assessment concluded short term (90-day average; e.g., quarterly) simazine exposures up to 12.5 ppb for frequently monitored sites and 37.5 ppb at predictive modeling sites are not of human health concern. The Illinois EPA criterion used in developing the Salem City Reservoir sets the simazine 90-day exposure at 4 ppb.

Syngenta Crop Protection respectfully requests that the Illinois EPA CWA 303(d) listing and TMDL development methodology be updated to reflect the science adopted by the USEPA in 2006 and cited by the Illinois EPA in the Salem City Reservoir draft TMDL. Syngenta further requests that the Salem City Reservoir draft TMDL be re-evaluated and re-written using the 2006 USEPA adopted simazine toxicological endpoints.

Syngenta Crop Protection requests that the Illinois EPA review the 10% frequency-of-exceedance criteria and how it relates to simazine. In Illinois EPA Integrated Water Quality Report the 10% frequency-of-exceedance is footnoted to the reference 35 IL Admin Code 302.302 and 302.306. Simazine is not listed in either reference. Syngenta believes that subpart 302 refers to compounds that bio-accumulate and fecal coliform. This assessment guideline is not applicable to simazine.

Response: IEPA used the critical period assessment data for implicit margin of safety. The critical period is when rainfall/runoff is highest usually during spring periods after herbicide application takes place and not all of the herbicide applied is adsorbed by the plants. Averaging the exceedances is accounting for that critical period of time. Implementation actions devoted to this critical period will reduce impairment of atrazine in the waters of the state.

4. There are numerous references and uses of the term MCL in the Salem City Reservoir draft TMDL. A correct definition of the MCL is presented in the fourth paragraph on page 7 “*an MCL for treated water is based on a running 4-quarter (i.e., annual) average, calculated quarterly, of samples collected at least once per quarter*”. However, in the pages and paragraphs identified below, the MCL has been taken out of context by eliminating the duration component of the definition. Syngenta requests that text changes be made to the above pages and paragraphs in the Salem City Reservoir TMDL to reflect the duration component when referring to the simazine MCL.

Response: Illinois EPA currently uses the simazine MCL of 4 ug/L. There have been no changes to the IPCB rules and regulations and in the Federal MCL as of today. Please visit our website (<http://www.epa.state.il.us/water/tmdl/atrazine-simazine.html>) that includes links to information on atrazine in drinking water (USEPA), atrazine reregistration (USEPA), atrazine information from the Federal Insecticide, Fungicide and Rodenticide Act (FIFRA) and Scientific Advisory Panel (SAP), atrazine toxicity from the Agency for Toxic Substances and Disease Registry (ATSDR) and atrazine studies by USGS.

5. There are 63 samples over 4 years when combining the Syngenta (2003, 2005 and 2006) and Illinois EPA (2010) simazine data sets. The maximum detected concentration was 10.07 ppb in 2006. This concentration is 2,990 ppb less than the acute 1-day DWLOC established by the USEPA in the 2006 Simazine RED. There is no acute human health exposure to simazine in Salem City Reservoir.

Ten quarterly averages were calculated when combining the Syngenta and Illinois EPA simazine data sets the maximum quarterly concentration was 5.93 ppb in the first quarter of 2006. This concentration is less than $\frac{1}{2}$ the 90-day DWLOC established by the USEPA in the 2006 Simazine RED. Simazine 90-day concentrations in Salem City Reservoir have not exceeded the USEPA simazine DWLOC.

Running 4-quarter averages were calculated by Syngenta for those time frames with 4 consecutive quarters of monitoring data using the combined Syngenta and Illinois EPA simazine data sets. There were eight consecutive quarters of monitoring data in 2005 and 2006. Five R4-QA were calculated. The maximum R4-QA in Salem City Reservoir was 3.37 ppb. This is below the simazine MCL in finished drinking water. Simazine running 4-quarter averages have not exceeded the MCL in Salem City Reservoir raw water.

The combined data show simazine concentrations in Salem City Reservoir (raw water) have been below the 1-day (acute), 90-day (quarterly) and running 4-quarter average (annual) finished drinking water standards. Syngenta requests that the Syngenta simazine monitoring data be accepted by the Illinois EPA and incorporated into the Salem City Reservoir data set. Syngenta also requests that the Salem City Reservoir TMDL be redrafted utilizing this data and the simazine water quality criteria and standards established in the USEPA 2006 Simazine Reregistration Eligibility Decision.

Response: Syngenta's simazine data has been included in the TMDL development and load capacity analysis.

6. The following is a quote from the Margin of Safety section of the draft TMDL *"The load reduction is based on exceedances during the months of June and July when exceedances were highest. This timeframe represents the critical condition when runoff and exceedance's of simazine are likely to occur."* These statements are contradictory to other statements, criterion and data used in the TMDL.
 - A) By Illinois EPA definition, there was only one exceedance in April, no plural.
 - B) During the months of June and July when *"exceedance's were highest"*, there were no exceedance(s). As there were no exceedance's in June and July, there is no basis for the TMDL.
 - C) By selecting the single sample concentration of 9.1 ppb as the current load instead of the average of spring and summer (April thru July) concentrations (3.81 ppb) an implicit margin of safety of **58%** has been introduced into the TMDL. In other words, using the average of concentrations, the April to July load would be 9.29 lbs... This is less than the allowable maximum capacity load of 9.8 lbs. No reduction in simazine load would be necessary. Goals of the TMDL have been met.

For drinking water MCL compliance, USEPA Office of Water (OW) and Illinois EPA Drinking Water unit utilize results that are rounded to one significant figure (the same number of significant digits as the MCL) as directed by USEPA/OW guidance (USEPA WSG 21, 1981; Attachment 3). In Section 6.1 TMDL Calculations, load should be based upon a simazine concentration of 0.00449 ppb. By not rounding (as required by SDWA for MCL compliance) a **12.3%** margin of safety is incorporated into the TMDL.

In Section 5.1 water quality data are summarized by impairment and discussed in relation to the maximum contaminant level (Tables 5 and 6). Data in Tables 5 and 6 are not compared in relation to the maximum contaminant level for simazine as they do not take the running 4-quarter average (R4-QA) duration into account. These are single sample concentrations and should not be compared to the MCL R4-QA. (e.g., one sample was greater than 4 ppb, the period average was 1.85 ppb). By incorporating this method into the need for a TMDL an implicit margin of safety of **54%** is added. (e.g., the average simazine concentration in 2010 in Salem City

Reservoir was 1.85 ppb or 54% below the MCL). The data show there was no exceedance of the simazine finished drinking water standard in Salem City Reservoir.

Response: The TMDL accounts for critical period when it is expected to have high simazine in runoff. Current regulations specify that TMDLs need to take into account critical conditions for stream flow, loading, and water quality parameters (see 40 CFR 130.7(c)(1)).

7. The Illinois EPA surface water monitoring program frequency decreases (or ceases) in the quarter's simazine concentrations are expected to be below or approaching the limits of analytical detection. It is twice as frequent in the quarters simazine is expected to occur. To calculate an implicit MOS range, a first quarter result equal to the fourth quarter result was used. (i.e. for 2010 the fourth quarter result was 0.14 ppb, this same value was used for first quarter 2011 and a R4-QA was calculated). The 2010 running 3-quarter average was compared to the calculated 2010 R4-QA, the difference was calculated and a percent margin of safety determined. In 2010 the difference was 0.43 ppb or 11% margin of safety ($1.85 \text{ ppb} - 1.42 \text{ ppb} = 0.43 \text{ ppb}$; $(0.43/4) * 100 = 11\%$). By skipping collection of samples in the first quarter, an **11%** implicit MOS was incorporated into the Salem City Reservoir TMDL.

Combined the implicit margin of safety incorporated into this TMDL is **135%**. This is a large and unreasonable implicit margin of safety added to water quality standards that include a 1000 fold safety factor. In comparison, the approved Total Phosphorous TMDL for Salem City Reservoir uses a 5% explicit and 0% implicit margin of safety. "A five percent (5%) explicit margin of safety has been incorporated into the Crooked Creek watershed Lake TMDLs" (Section 6.1.7 pg. 28; TMDL Development for the Crooked Creek Watershed, Illinois, Final Report, May 29, 2008).

Syngenta requests that the implicit margin of safety be reduced by implementing a 4-quarter monitoring program, incorporating SDWA authorized rounding procedures, and utilizing loading parameters that are based on seasonal averages rather than average of "exceedances". An explicit + implicit margin of safety for simazine should equal that of the 5% MOS used in the Salem City Reservoir total phosphorous TMDL in 2008.

Response: IEPA does not sample lakes during the winter period due to no boat access from ice on the lake. This accounts for the raw water sampling used for assessments. IEPA also uses the Drinking Water Program assessment. This program uses finished water data provided by the water plant. Water treatment plants are required to send in at least one data analysis from all quarters of the year. The Syngenta assessment data from 2009 to 2011 was used for developing the simazine TMDL for Salem City Reservoir.

8. Illinois EPA assessment for public water supply use considers both the raw and finished water quality data for the last three years of available data. The draft TMDL is based upon six samples collected over seven months in one year. A 55% reduction of simazine is specified in the watershed based only on one sample collected in April of 2010. A TMDL should not be based upon a single sample. Additional data have been submitted to IEPA that show there is no need for a Salem City Reservoir TMDL for simazine; these data are discussed and re-submitted as part of these comments.

Syngenta requests that the Illinois EPA withdraw this TMDL and update the science and criteria that were utilized in its development.

Response: See Response #4.

9. Commodity groups, the Salem CWS, agricultural producers, government agencies and other stakeholders have worked diligently since the mid-1990s on herbicide management and the promotion of best management practices to minimize and control herbicide runoff in the Salem City Reservoir watershed.

Response: The report includes implementation plan for best management practices and available funding sources. We hope future implementation actions will show reduced pollutants in the watershed during the next Integrated Water Quality Report assessment cycle.

10. Illinois Farm Bureau (IFB) and the Marion County Farm Bureau (CFB) understand that the TMDL process takes time; however, the proposed TMDL is based on Illinois EPA data that is not current and does not accurately reflect the current water quality of Salem City Reservoir. Specifically, the most recent Illinois EPA data relied upon for the draft TMDL is from 2010 and is, therefore, three years old.

In addition, the Illinois EPA data is limited in scope in that it is comprised of only six samples from one location taken over a period of only seven months in 2010.

Response: As discussed in item 7, the Syngenta assessment data from 2009 to 2011 was used for developing the simazine TMDL for Salem City Reservoir.

11. During the public meeting, there was a lot of discussion regarding issues with the data used by Illinois EPA in its assessment, and the process of that assessment. The City of Salem commented about its concern that the TMDL was giving citizens the wrong idea as there is no problem with simazine in the finished water. Illinois EPA staff, in response to concerns raised by the City of Salem, agreed to provide an explanation of why Illinois EPA applies the drinking water standard to raw water. In addition, the City of Salem noted that it recently started taking quarterly samples of the raw water for simazine/atrazine. The City also offered to provide that certified data to Illinois EPA for its use in the assessment in order to prove that there is no atrazine/simazine issue in the watershed and for the TMDL to be removed. In addition, a Syngenta representative present at the public meeting also acknowledged that Syngenta has data through 2006 for the watershed and would provide that to Illinois EPA for its consideration.

Response: All available simazine data including data that was received during the public comment period has been included in the TMDL development and load capacity analysis for this report.

12. The draft TMDL report discusses work done in 2000 by the City of Salem regarding a destratisfier and adding a fountain to address algal problems; work done in 2002 by the City of Salem pursuant to a Section 319 grant for spillway repair and shoreline stability; and work done in 2005 by the City of Salem regarding rip rap. The draft TMDL report also mentions a previous TMDL in the watershed from 2008. Were any projects done in the watershed as a result of the 2008 TMDL?

Overall, it is very likely that actions taken through the above mentioned projects have resulted in load reductions of simazine. As such, BMPs currently in practice in the Salem City Reservoir watershed should be considered as Illinois EPA determines whether a TMDL is necessary in this watershed.

Response: All available watershed projects have been included in the report. As discussed in item 9, we hope future implementation actions will show reduced pollutants in the watershed.

13. Illinois Farm Bureau and Marion County Farm Bureau recommend that Illinois EPA focus its resources at this time on collecting additional data and information to more thoroughly characterize the current water quality of the Salem City Reservoir watershed. The TMDL process allows for this additional review in what is referred to as "Stage 2." Specifically, Illinois EPA should review the sample results relied upon for the draft TMDL and collect additional samples to build a more robust, updated and accurate data set before moving forward with developing a TMDL for the Salem City Reservoir watershed. In addition, Illinois EPA should consider the current BMPs in place in the watershed when determining whether a TMDL is even necessary.

Response: After reviewing the pesticide data from the ten lakes listed as high priority for TMDL development due to atrazine and/or simazine (refer to <http://www.epa.state.il.us/water/tmdl/303-appendix/2014/appendix-a3.pdf>, the Agency did not find the need for additional data.
